Preface

Congratulations on your purchase of the Busch compressor. With watchful observation of the field’s requirements, innovation and steady development Busch delivers modern vacuum and pressure solutions worldwide.

These operating instructions contain information for

- product description,
- safety,
- transport,
- storage,
- installation and commissioning,
- maintenance,
- overhaul,
- troubleshooting and
- spare parts of the compressor.

Version with ATEX-drive motor:

The ATEX-drive motor is subject to a separate instruction manual.

For the purpose of these instructions, “handling” the compressor means the transport, storage, installation, commissioning, influence on operating conditions, maintenance, troubleshooting and overhaul of the compressor.

Prior to handling the compressor these operating instructions shall be read and understood. If anything remains to be clarified please contact your Busch representative!

Keep these operating instructions and, if applicable, other pertinent operating instructions available on site.
Product Description

Use

The compressor is intended for
- the suction
- mixtures of dry, non-aggressive and non-toxic gases and/or dust according to the identification on the nameplate of the compressor (explanation see below).

Conveying media with a lower or higher density than air leads to an increased thermal and/or mechanical load on the compressor and is permissible only after prior consultation with Busch.

Max. allowed temperature of the inlet gas: 40 °C

According to the directive 94/9/EC ("ATEX 95") the compressor is made for the intended use in potentially explosive areas according to the data given on the nameplate of the compressor and on the data given on the nameplate of the drive motor.

This requires a separate consideration of the conveyed gas/air or dust/air mixtures on the one side and the environment of the compressor on the other. On the nameplate of the compressor the classification with regard to the conveyed gas/air or dust/air mixtures is marked with an "inside", while the classification with regard to the environment is marked with an "outside". The classification of the motor always refers to the environment.

In case Busch delivered the compressor without drive motor or a replacement motor is to be mounted or for economic reasons the compressor was equipped with a simpler motor, the following must be observed:

In case the classifications of the compressor and of the drive motor are different the inferior classification is relevant. This means also that the compressor is suitable for the placement in a potentially explosive environment only if both the compressor, the coupling and the drive motor are approved to the required extent for use in potentially explosive areas.

Depending on the version the approval is valid only together with certain standard or optional components, or is limited by the use of certain optional components, as described below and in the chapter Operational Options / Use of Optionally Available Equipment (⇒ page 4).

The classification on the compressor is to be read as follows (interpretations of equipment categories and zones for information only; the relevant laws, directives and standards are literally binding; for temperature classes and explosion groups see E. Brandes, W. Möller "Sicherheitstechnische Kenngrößen, Band 1: Brennbare Flüssigkeiten und Gase", ISBN 3–89701–745–8 (or equivalent source)):

- inside: II XG II B3 TX
- outside: II XG II B3 TX

In case “Aqua” is used, the last number of the temperature class is reduced by 1, i.e.: II B2

a Pressure relief lines with collecting line
b Gas inlet
c Terminal box
d Nameplate, compressor
e Inspection port, cooling air duct
f Terminal box, temperature measurement system
g Oil sight glass h Cover
i Eye bolt
j Equipotential bonding rail
k Pressure switch/indicator
l Nameplate, drive motor
m Connection for equipotential bonding, inlet air filter
n Inlet air filter (depending on version)
o Cooling air outlet
p Cooling air inlet
q Position of condensate drain cock (optional for version "Aqua")
r Directional arrow
s Safety valve
t Gas recirculation line
u Gas discharge
v Acoustic enclosure
w Cylinder
x Rotors
y Non-return valve

In case both the compressor and the drive motor are approved, the compressor together with the coupling and the drive motor are classified together.

MM 1202, 1252, 1322 AP ATEX-Version, Gas Tight
inside = in this line classification for explosive atmosphere inside the compressor

II 2G IIB3 TX = in the process gas explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas likely to occur in normal operation occasionally; if the process gas contains dust, also if the dust is not combustible, the use of a special ATEX-inlet air filter (with equipotential bonding) is required; temperature monitoring is required (resistance thermometer and temperature-transmitter in standard scope of delivery);

II 3G IIB3 TX = in the process gas explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas not likely to occur in normal operation but, if it does occur, will persist for a short period only; if the process gas contains dust, also if the dust is not combustible, the use of a special ATEX-inlet air filter (with equipotential bonding) is required; temperature monitoring is required (resistance thermometer and temperature-transmitter in standard scope of delivery);

II 3D TX C = in the process gas explosive atmosphere in the form of a cloud of combustible dust in air not likely to occur in normal operation but, if it does occur, will persist for a short period only; the use of the special ATEX-inlet air filter (with equipotential bonding) is required;

outside = in this line classification for explosive atmosphere in the environment of the compressor

II 2G IIB3 TX = in the environment explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist likely to occur in normal operation occasionally; temperature monitoring is required (resistance thermometer and temperature-transmitter in standard scope of delivery); sufficiently qualified ATEX-drive motor is required;

II 3G IIB3 TX = in the environment explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist not likely to occur in normal operation but, if it does occur, will persist for a short period only; temperature monitoring is required (resistance thermometer and temperature-transmitter in standard scope of delivery);

II 3D TX C = in the environment explosive atmosphere in the form of a cloud of combustible dust in air not likely to occur in normal operation but, if it does occur, will persist for a short period only; temperature monitoring is required (resistance thermometer and temperature-transmitter in standard scope of delivery); sufficiently qualified ATEX-drive motor is required

Version "Aqua":

The compressor features the corrosion protection coating CPC and is capable of conveying water vapour (⇒ page 12: Conveying Condensable Vapours). Conveyance of other vapours shall be agreed upon with Busch. Conveyance of water or other liquids in liquid phase increases the power consumption and shall therefore be avoided (risk of drive overload).

The compressor is thermally suitable for continuous operation (100 percent duty).

Max. permissible number of startings per hour: 12

The maximum allowed pressure on the pressure connection is 0.7 ... 2.0 barg (the nameplate of the compressor indicates the valid pressure). By means of process control it must be made sure that the maximum allowed pressure will not be exceeded.

The safety valve on the compressor protects the compressor against overload only. It is no pressure limiting device in terms of EN 1012-1 for the pressure system. It is not designed for frequent use and must therefore not be used as a system pressure regulating valve.

Note: The safety valve routes compressed product gas back to the gas inlet. This will increase the gas inlet temperature. In case of continuous operation of the safety valve the temperature monitoring will therefore shut down the compressor.

The compressor is not absolutely gas tight. In case of conveying air in new conditions of the compressor the leakage rate amounts to 1.5 hPa l/s (=mbar l/s) at 2 barg. Due to illegal pressures at the gas connections, worn shaft seal rings or clogged pressure relief lines this leakage rate can rise considerably. Make sure that the installation space or location is vented such that in case of conveying media which are dangerous to health no impermissible accumulation of conveyed media in the environment of the compressor will occur. The installation space or location must be vented sufficiently.

The approval for use in potentially explosive atmospheres is valid for the compressor together with the described measurement and safety equipment. The approval is void if the system is altered or if the scheduled maintenance is not complied with. Maintenance must be performed by specifically instructed personnel only.

Safety Concept

Version with temperature monitoring:

The safety concept is based on the prevention of excessive temperatures by means of a gas temperature sensor in the vicinity of the stage gas outlet (=zone of highest temperature) together with various other measures to prevent sparks. The temperature sensor must be integrated into the system control such that operation of the compressor will safely be inhibited if the shutdown temperature (see nameplate) is exceeded.

Version with pressure monitoring at the gas outlet (optional):

In order to ensure the gas tightness the pressure at the gas outlet is monitored. The pressure switch/indicator must be integrated into the system control such that the compressor will be switched off if the pressure gets outside the range from -200 mbarg to +200 mbarg.

*unless specified otherwise on the nameplate of the compressor.

Operational Options / Use of Optionally Available Equipment

Operation with varying speed, i.e. with a frequency inverter is permitted, provided that the drive motor is approved for frequency inverter operation and the allowed speed range is given on the nameplate of the compressor.

The system control must be designed such that no speed outside the permissible range can be set.
Operation with Vacuum Relief Valve / Ambient Air Valve

In case the pressure control in the suction side of the system cannot be achieved by means of process control or by controlling the drive motor, the pressure needs to be controlled by means of a vacuum relief valve (optional).

For the version “Aqua” it can be necessary to dry the compressor after process end by means of conveying ambient air (➔ page 12: Conveying Condensable Vapours).

However, if vacuum relief valves/ ambient air valves are used the following must be observed:

**WARNING**

By means of the vacuum relief valve/ ambient air valve the process gas gets usually mixed with ambient air, with the mixing ratio depending on the current working pressure of the compressor.

For certain process gases the mixing with air increases the explosion risk because of the oxygen contained herein.

So the vacuum relief valve/ ambient air valve must be considered when the zone inside the compressor is being established.

If the mixing of process gas and ambient air created an illegal zone inside the compressor, feeding of ambient air would not be allowed. In this case an inert dry gas must be fed.

Apart from this:

Aspiration of ambient air from a zone 1 or a zone 2 (potentially explosive gas atmospheres) is permitted only if the compressor is approved for the conveyance of these gases. It is recommended to install an ATEX-air filter (with equipotential bonding) upstream the vacuum relief valve/ ambient air valve.

Aspiration of ambient air from a zone 21 or a zone 22 (potentially explosive dust/air atmospheres) is permitted only if an ATEX-air filter (with equipotential bonding) is installed upstream the vacuum relief valve/ ambient air valve.

Aspiration of ambient air from areas not classified as potentially explosive is permitted. It is recommended to install an air filter upstream the vacuum relief valve/ ambient air valve.

**Principle of Operation**

The compressor works on the claw principle.

The components are dimensioned such, that on the one hand there is never contact between the two claws or between a claw and the cylinder, on the other hand the gaps are small enough to keep the clearance loss between the chambers low.

In order to avoid the suction of solids, the compressor is equipped with a screen in the suction connection.

In order to avoid reverse rotation after switching off, the compressor is equipped with a non-return valve (W).

The compressor compresses the inlet gas absolutely oil-free. A lubrication of the pump chamber is neither necessary nor allowed.

**Cooling**

The compressor is cooled by

- radiation of heat from the surface of the compressor
- the air flow from the fan wheel of the drive motor
- the process gas
- the air flow from the fan wheel on the shaft of the compressor

**Start Controls**

The compressor comes without start controls. The control of the compressor is to be provided in the course of installation.

**Safety**

**Intended Use**

Definition: For the purpose of these instructions, “handling” the compressor means the transport, storage, installation, commissioning, influence on operating conditions, maintenance, troubleshooting and overhaul of the vacuum.

The compressor is intended for industrial use. It shall be handled only by qualified personnel.

The allowed media and operational limits (➔ page 3: Product Description) and the installation prerequisites (➔ page 6: Installation Prerequisites) of the compressor shall be observed both by the manufacturer of the machinery into which the compressor is to be incorporated and by the operator.

The maintenance instructions shall be observed.

In particular the intended use in potentially explosive areas, i.e. either inside the compressor or in its adjacency potentially explosive atmosphere can occur, requires that the compressor is equipped accordingly and carries the Ex-mark and that the associated documentation acc. to the directive 94/9/EC is available.

Prior to handling the compressor these installation and operating instructions shall be read and understood. If anything remains to be clarified please contact your Busch representative!

**Safety Notes**

The compressor has been designed and manufactured according to state-of-the-art methods. Nevertheless, residual risks may remain. These operating instructions highlight potential hazards where appropriate. Safety notes are tagged with one of the keywords DANGER, WARNING and CAUTION as follows:

**DANGER**

Disregard of this safety note will always lead to accidents with fatal or serious injuries.

**WARNING**

Disregard of this safety note may lead to accidents with fatal or serious injuries.
Transport

Transport in Packaging
Packed on a pallet the compressor is to be transported with a forklift.

Transport without Packaging
In case the compressor is packed in a cardboard box with inflated cushions:
- Remove the inflated cushions from the box
In case the compressor is packed in a cardboard box cushioned with rolled corrugated cardboard:
- Remove the corrugated cardboard from the box
In case the compressor is laid in foam:
- Remove the foam
In case the compressor is bolted to a pallet or a base plate:
- Remove the bolting between the compressor and the pallet/base plate
In case the compressor is fastened to the pallet by means of tightening straps:
- Remove the tightening straps

Storage

Short-term Storage
- Make sure that the suction connection and the gas discharge are closed (leave the provided plugs in)
- Store the compressor
  - If possible in original packaging,
  - indoors,
  - dry,
  - dust free and
  - vibration free.

Conservation
In case of adverse ambient conditions (e.g. aggressive atmosphere, frequent temperature changes) conserve the compressor immediately. In case of favourable ambient conditions conserve the compressor if a storage of more than 3 months is scheduled.
- Make sure that all ports are firmly closed; seal all ports that are not sealed with PTFE-tape, gaskets or o-rings with adhesive tape

Note: VCI stands for “volatile corrosion inhibitor”. VCI-products (film, paper, cardboard, foam) evaporate a substance that condenses in molecular thickness on the packed good and by its electro-chemical properties effectively suppresses corrosion on metallic surfaces. However, VCI-products may attack the surfaces of plastics and elastomers. Seek advice from your local packaging dealer! Busch uses CORTEC VCI 126 R film for the overseas packaging of large equipment.
- Wrap the compressor in VCI film
- Store the compressor
  - If possible in original packaging,
  - indoors,
  - dry,
  - dust free and
  - vibration free.

For commissioning after conservation:
- Make sure that all remains of adhesive tape are removed from the ports
- Commission the compressor as described in the chapter Installation and Commissioning (➔ page 6)

---

CAUTION
Disregard of this safety note may lead to accidents with minor injuries or property damage.

Noise Emission
For the sound pressure level in free field according to EN ISO 2151 ➔ page 56: Technical Data.

CAUTION
The compressor emits noise of high intensity in a narrow band.
Risk of damage to the hearing.
Persons staying in the vicinity of a non noise insulated compressor over extended periods shall wear ear protection.

---

Do not walk, stand or work under suspended loads.

- Make sure that the eyebolts are in faultless condition (replace damaged, e.g. bent eyebolts with a new ones)
- Make sure that the eyebolts are fully screwed in and tightened by hand
- Attach lifting gear securely to the eyebolts on the synchronising gear (i) and on the drive motor
In case the drive motor comes without an eyebolt or the eyebolt on the drive motor is located at an unfavourable position:
- Loop a belt/rope with suitable length and strength around the flange of the drive motor
- Attach the lifting gear to a crane hook with safety latch
- Lift the compressor with a crane
In case the compressor was bolted to a pallet or a base plate:
Installation and Commissioning

Installation prerequisites

**CAUTION**
In case of non-compliance with the installation prerequisites, particularly in case of insufficient cooling:

- Risk of damage or destruction of the compressor and adjoining plant components!
- Risk of injury!
- The installation prerequisites must be complied with.

- Make sure that the integration of the compressor is carried out such that the essential safety requirements of the Machine Directive 2006/42/EC are complied with (in the responsibility of the designer of the machinery into which the compressor is to be incorporated; ➔ page 55: note in the EC-Declaration of Conformity)

**Mounting Position and Space**
- Make sure that the following ambient conditions will be complied with:
  - dry and free from corrosion-promoting gases, vapours, mists and dusts
  - ambient temperature: 0 … 40 °C
  - ambient pressure: atmospheric
  - altitude of location: up to 1000 m above sea level
- Make sure that the environmental conditions comply with the protection class of the drive motor (according to the nameplate)
- Make sure that the compressor can neither inadvertently nor intentionally be stepped on and cannot be used as a support for heavy objects
- Make sure that the compressor cannot be hit by falling objects
- Make sure that the compressor will be placed or mounted horizontally
- Make sure that the base for placement / mounting base is even
- Make sure that in order to warrant a sufficient cooling there will be a clearance of minimum 1 m between the compressor and nearby walls
- Make sure that no heat sensitive parts (plastics, wood, cardboard, paper, electronics) will touch the surface of the compressor
- Make sure that the installation space or location is vented such that a sufficient cooling of the compressor is warranted

**CAUTION**
The compressor is not absolutely gas tight

Risk of damage to health!

Make sure that the installation space or location is vented such that in case of conveying media which are dangerous to health no impermissible accumulation of conveyed media in the environment of the compressor will occur.

- Make sure that the installation space or location is vented such that even in the case of an impaired gas tightness of the compressor (e.g. due to illegal pressures at the gas discharge, worn shaft seal rings or clogged pressure relief lines) no impermissible accumulation of process gas in the environment of the compressor will occur. Closed cooling air circuits are not permitted.

**Suction Connection**

**CAUTION**
Intruding foreign objects or liquids can destroy the compressor.

In case the inlet gas can contain dust or other foreign solid particles:
- Make sure that a suitable filter (5 micron or less) is installed upstream the compressor (included in scope of delivery)
- Make sure that the filter is sufficiently ATEX-qualified (electrically conductive, with equipotential bonding etc.; also for non-combustible dusts!)
- Make sure that the suction line fits to the suction connection of the compressor

Version for the conveyance of explosive atmospheres consisting of a mixture with air of flammable substances in the form of gas:
- Make sure that the pipe is made from electrically conductive material and equipped with an equipotential bonding connection (execution according to EN 60079-14 or equivalent national or local regulations)

Version for the conveyance of explosive atmospheres in the form of a cloud of combustible dust in air:
- Make sure that the pipe is made from electrically conductive material and equipped with an equipotential bonding connection (execution according to EN 61241-14 or equivalent national or local regulations)
- Make sure that the pipe will cause no stress on the compressor's connection, if necessary use an expansion joint
- Make sure that the line size of the suction line over the entire length is at least as large as the suction connection of the compressor

In case the length of the suction line exceeds 2 m it is prudent to use larger line sizes in order to avoid a loss of efficiency and an overload of the compressor. Seek advice from your Busch representative!

In case the compressor shall be maintained after shutdown of the compressor:
- Provide a manual or automatic operated valve (= non-return valve) in the suction line

Version “Aqua”, if very humid process gases and/or adverse operating cycles bear the risk, that condensates remain in the compressor:
- Provide a shut-off valve, a drip-leg and a drain cock in the suction line, so that condensates can be drained from the suction line
- Provide a valve for the unthrottled suction of ambient air (ambient air valve) between the shut-off valve and the...
compressor (in order to dry the compressor after process end). For non ultimate-pressure-proof compressors provide a vacuum relief valve (suitable for continuous operation) for the throttled aspiration of ambient air during warming up.

Observe the limitations with regard to the aspiration of ambient air (page 4: Operation with Vacuum Relief Valve / Ambient Air Valve)

- Make sure that the anti-pulsation chamber is equipped with a condensate drain cock (optional); (if the condensate drain cock is missing contact the Busch service)
- Make sure that the suction line does not contain foreign objects, e.g. welding scales

Gas Discharge

The discharged gas must flow without obstruction. It is not permitted to shut off or throttle the discharge line or to use it as a pressurised air source.

**WARNING**

In case the compressor is intended to convey potentially explosive gases/gas mixtures (page 3: Product Description):

Risk of explosion in the discharge area!

The process gas/gas mixture must be disposed of such that no potentially explosive gas mixtures can accumulate in the discharge area.

- Make sure that the discharge line fits to the gas discharge of the compressor
- Make sure that the suction lines is designed for 2.0 barg and 250°C

Version for the conveyance of explosive atmospheres consisting of a mixture with air of flammable substances in the form of gas:

- Make sure that the pipe is made from electrically conductive material and equipped with an equipotential bonding connection (execution according to EN 60079-14 or equivalent national or local regulations)
- Make sure that the pipe will cause no stress on the compressor’s connection, if necessary use an expansion joint
- Make sure that the line size of the discharge line over the entire length is at least 2”

In case the length of the discharge line exceeds 2 m it is prudent to use larger line sizes in order to avoid a loss of efficiency and an overload of the compressor. Seek advice from your Busch representative!

- Make sure that the discharge line either slopes away from the compressor or provide a liquid separator or a drip leg with a drain cock, so that no liquids can back up into the compressor

Electrical Connection / Controls

Version with ATEX-drive motor:

- Make sure that installation instructions for the ATEX-drive motor (separate leaflet) are available
- Observe the instructions given in the installation instructions manual for the ATEX-drive motor
- Make sure that the stipulations acc. to the EMC-Directive 2004/108/EC and Low-Voltage-Directive 2006/95/EC as well as the EN-standards, electrical and occupational safety directives and the local or national regulations, respectively, are complied with (this is the responsibility of the designer of the machinery into which the compressor is to be incorporated; page 52: note in the EC-Declaration of Conformity).
- Make sure that the power supply for the drive motor is compatible with the data on the nameplate of the drive motor
- Make sure that an overload protection according to EN 60204-1 is provided for the drive motor
- Make sure that the drive of the compressor will not be affected by electric or electromagnetic disturbance from the mains; if necessary seek advice from the Busch service

In case of mobile installation:

- Provide the electrical connection with grommets that serve as strain-relief

Version with temperature monitoring:

- Execute the interfaces for the temperature measurement system in the system control according to the instructions of the manufacturer (page 19: Equipment Documentation Measurement and Safety Instrumentation); applicable shutdown temperature – nameplate of the compressor

Version with pressure monitoring at the gas outlet (optional):

- Execute the interface for the pressure switch/indicator in the system control according to the safety concept (page 4: Safety Concept) and according to the instructions of the manufacturer (page 21: Equipment Documentation Measurement and Safety Instrumentation)
- Make sure that an earth point is available for connection to the equipotential bonding rail or the ATEX-inlet air filter resp.

Electrical circuits in zone 1 (outside) shall be executed intrinsically safe in protection class ib acc. to EN 60079-11. All signal lines shall be executed with shielded cables according to EN 60079-14 or EN 61241-14 or the equivalent national or local regulations.

Installation

Mounting

- Make sure that the installation prerequisites (page 6) are complied with
- Set down or mount the compressor at its location

Checking Synchronising Gear Oil

The compressor is delivered with oil filled synchronising gear. The level shall be slightly above the middle of the sight glass.
- Check on the sight glass that the proper amount of oil is filled

Connecting Electrically

**WARNING**

Risk of electrical shock, risk of damage to equipment.

Electrical installation work must only be executed by qualified personnel that knows and observes the following regulations:
- IEC 364 or CENELEC HD 384 or DIN VDE 0100, respectively,
- IEC-Report 664 or DIN VDE 0110,
- BGV A2 (VBG 4) or corresponding national accident prevention regulation.

Version with ATEX-drive motor:

- Connect the drive motor according to the installation instructions for the drive motor (separate leaflet)

Version with non-ATEX-drive motor:
• Connect the drive motor according to the installation instructions given below

⚠️ CAUTION
The connection schemes given below are typical. Depending on the specific order or for certain markets deviating connection schemes may apply.
Risk of damage to the drive motor!
The inside of the terminal box shall be checked for drive motor connection instructions/schemes.

• Electrically connect the drive motor
• Connect the protective earth conductor

Delta connection (low voltage):

Star connection (high voltage):

Double star connection, multi-voltage motor with 9 terminals (low voltage):

Star connection, multi-voltage motor with 9 terminals (high voltage):

Double star connection, multi-voltage motor with 12 terminals (low voltage):

Delta connection, multi-voltage motor with 12 terminals (middle voltage):

Star connection, multi-voltage motor with 12 terminals (high voltage):

Double star connection, multi-voltage motor with 12 terminals (low voltage):
Checking the Function of the Measurement and Safety Instrumentation

(Version with temperature monitoring only)

- Make sure that the compressor aspirates inert gases and that there are no potentially explosive atmospheres in the environment
- Open the lid of the temperature measurement system
- Disconnect the white cable from pin 3, the first red cable from pin 5 and the second red cable from pin 6
- In order to simulate the resistance thermometer Pt100 set a variable ohmic resistance to approx. 100 \( \Omega \)
- Connect the variable ohmic resistance with 3 identical cables to the pins 3, 5 and 6 of the temperature transmitter as shown in the sketch (the cable connected to pin 5 compensates the cable resistance)
- Switch on the compressor
- Increase the ohmic resistance to the resistance at shutdown temperature according to the Equipment Documentation Measurement and Safety Instrumentation (➔ page 21)
- Make sure that an alarm is released in the system control and the compressor is shut down automatically
- Decrease the ohmic resistance to a value less than the shutdown point
- Make sure that the alarm persists
- Make sure that the compressor does not start self-acting
- Switch on the compressor again
- Interrupt the ohmic resistance
- Make sure that a fault indication is released in the system control and the compressor is shut down automatically
- Reconnect the variable ohmic resistance
- Switch on the compressor again
- Short circuit the variable ohmic resistance
- Make sure that a fault indication is released in the system control and the compressor is shut down automatically
- Remove the short circuit
- Remove the variable ohmic resistance

WARNING
Risk of electrical shock, risk of damage to equipment.

Electrical installation work must only be executed by qualified personnel that knows and observes the following regulations:
- IEC 364 or CENELEC HD 384 or DIN VDE 0100, respectively,
- IEC-Report 664 or DIN VDE 0110,
- BGV A2 (VBG 4) or corresponding national accident prevention regulation.
• Reconnect the resistance thermometer Pt100 to the temperature transmitter (white cable to pin 3, first red cable to pin 5, second red cable to pin 6, → sketch)

• Firmly close the temperature measurement system (g) with the lid

Recording of Operational Parameters
As soon as the compressor is operated under normal operating conditions:
• Measure the drive motor current and record it as reference for future maintenance and troubleshooting work

Operating Notes
Use

WARNING
The compressor is designed for operation under the conditions described below.

In case of disregard risk of explosion!
The compressor must only be operated under the conditions described below.

WARNING
Operating a faulty compressor puts the explosion safety at risk.

Risk of explosion!
The compressor must only be operated in faultless condition. A faulty compressor must immediately be removed from service.

The compressor is intended for
– the suction of
– mixtures of dry, non-aggressive and non-toxic gases and/or dust according to the identification on the nameplate of the compressor (explanation see below).

Conveying media with a lower or higher density than air leads to an increased thermal and/or mechanical load on the compressor and is permissible only after prior consultation with Busch.

Max. allowed temperature of the inlet gas: 40 °C

According to the directive 94/9/EC ("ATEX 95") the compressor is made for the intended use in potentially explosive areas according to the data given on the nameplate of the compressor and on the data given on the nameplate of the drive motor.

This requires a separate consideration of the conveyed gas/air or dust/air mixtures on the one side and the environment of the compressor on the other. On the nameplate of the compressor the classification with regard to the conveyed gas/air or dust/air mixtures is marked with an "inside", while the classification with regard to the environment is marked with an "outside". The classification of the motor always refers to the environment.

In case Busch delivered the compressor/compressor without drive motor or a replacement motor is to be mounted or for economic reasons the compressor was equipped with a simpler motor, the following must be observed:

In case the classifications of the compressor and of the drive motor are different the inferior classification is relevant. This means also that the compressor is suitable for the placement in a potentially explosive environment only if both the compressor, the coupling and the drive motor are approved to the required extent for use in potentially explosive areas.

Depending on the version the approval is valid only together with certain standard or optional components, or is limited by the use of certain optional components, as described below and in the chapter Operational Options / Use of Optionally Available Equipment (→ page 4).

The classification on the compressor is to be read as follows (interpretations of equipment categories and zones for information only; the relevant laws, directives and standards are literally binding; for temperature classes and explosion groups see E. Brandes, W. Möller "Sicherheitstechnische Kenngrößen, Band 1: Brennbare Flüssigkeiten und Gase", ISBN 3–89701–745–8 (or equivalent source)):

1 = Execution according to directive 94/9/EC
2 = inside = in this line classification for explosive atmosphere inside the compressor
3 = II 2G II B3 TX = in the process gas explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas likely to occur in normal operation occasionally; if the process gas contains dust, also if the dust is not combustible, the use of a special ATEX-inlet air filter (with equipotential bonding) is required; temperature monitoring is required (resistance thermometer and temperature-transmitter in standard scope of delivery);
4 = II 3G II B3 TX = in the process gas explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas not likely to occur in normal operation but, if it does occur, will persist for a short period only; if the process gas contains dust, also if the dust is not combustible, the use of a special ATEX-inlet air filter (with equipotential bonding) is required; temperature monitoring is required (resistance thermometer and temperature-transmitter in standard scope of delivery);
5 = outside = in this line classification for explosive atmosphere in the environment of the compressor
6 = II 2G II B3 TX = in the environment explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist likely to occur in normal operation occasionally; temperature monitoring is required (resistance thermometer and temperature-transmitter in standard scope of delivery); sufficiently qualified ATEX-drive motor is required;
7 = II 3G II B3 TX = in the environment explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist not likely to occur in normal operation but, if it does occur, will persist for a short period only; temperature monitoring is required (resistance thermometer and temperature-
The compressor is equipped with pressure relief lines (a) between the pump stage and the gas inlet (b). The pressure relief lines and shaft seal rings safeguard that no process gases will escape into the environment of the compressor.

The proper function of the compressor requires ambient pressure +/- 200 hPa (=mbar) to be present at the gas inlet (b) at any operating point.

The pressure switch/indicator (optional) is to be integrated into the system control such that the maintenance of the permitted pressure range will be monitored. If the pressure gets outside this range the system control must automatically shut down the compressor.

The compressor is thermally suitable for continuous operation (100 percent duty).

The maximum allowed pressure on the pressure connection is 0.7 ... 2.0 barg (the nameplate of the compressor indicates the valid pressure). By means of process control it must be made sure that the maximum allowed pressure will not be exceeded.

The compressor features the corrosion protection coating CPC and is capable of conveying water vapour († page 12: Conveying Condensable Vapours). Conveyance of other vapours shall be agreed upon with Busch. Conveyance of water or other liquids in liquid phase increases the power consumption and shall therefore be avoided (risk of drive overload).

The compressor is thermally suitable for continuous operation (100 percent duty).

Max. permissible number of startings per hour: 12

The compressor emits noise of high intensity in a narrow band.

Risk of damage to the hearing.

Persons staying in the vicinity of a non noise insulated compressor over extended periods shall wear ear protection.

- Make sure that all provided covers, guards, hoods etc. remain mounted
- Make sure that protective devices will not be disabled
- Make sure that cooling air inlets and outlets will not be covered or obstructed and that the cooling air flow will not be affected adversely in any other way
- Make sure that the installation prerequisites († page 6: Installation Prerequisites) are complied with and will remain complied with, particularly that a sufficient cooling will be ensured

Conveying Condensable Vapours

Version “Aqua”:

♦ Close the shut-off valve in the suction line
♦ Warm up the compressor for approx. 10 minutes

At process start:
♦ Open the shut-off valve in the suction line

At the process end:
♦ Close the shut-off valve in the suction line
♦ Open the ambient air valve
♦ Operate the compressor for another approx. 10 minutes
♦ Close the ambient air valve
Maintenance

Maintenance work must be executed by qualified personnel, specially instructed in the maintenance of this type of compressor by Busch.

MONTHLY

In case of dusty process gases:

♦ Open the suction connection
♦ Operate the compressor for approx. 5 minutes with unrestricted suction
♦ Make sure that the compressor is shut down and locked against inadvertent start up

In case an inlet air filter (n) is installed:
♦ Check the inlet air filter, if necessary replace

In case of operation in a dusty environment:
♦ Clean as described under ➔ page 13: Every 6 Months

EVERY 3 MONTHS:

♦ Make sure that the compressor is shut down and locked against inadvertent start up
♦ Check the level of the synchronising gear oil
The level shall be slightly above the middle of the sight glass (e). The level of the synchronising gear should stay constant over the lifetime of the oil. If the level does fall, the gear is leaky and the compressor requires repair (Busch service).

EVERY 6 MONTHS:

♦ Make sure that the housing is free from dust and dirt, clean if necessary
♦ Make sure that the compressor is shut down and locked against inadvertent start up
♦ Remove the acoustic enclosure

Note: Any kind of deposit on the compressor compromises the explosion safety of the compressor.
Deposits on a fan wheel deteriorate the balancing quality of the fan wheel, which compromises the explosion safety further.
♦ Remove the protective grid from the cooling air outlet
♦ Open the inspection port on the cooling air duct
♦ Clean the cooling air duct (compressed air)

Note: Make sure that the foam mats do not get soaked with water
♦ Clean the fan cowlings, fan wheels, the ventilation grilles and cooling fins

Note: The maintenance intervals depend very much on the individual operating conditions. The intervals given below are upper limits that must not be exceeded. Particularly heavy duty operation, such like high dust loads in the environment or in the process gas, other contaminations or ingress of process material, can make it necessary to shorten the maintenance intervals significantly.
**Version with ROTEX-coupling:**
- Remove the drive motor
- Measure the dimension B of the coupling element
- Replace the coupling element if the measured value < B\(_{\text{min}}\)
- Remount the drive motor

**Every 10000 Operating Hours, At the Latest after 2 Years**

<table>
<thead>
<tr>
<th>Rotex 38</th>
<th>Rotex 42</th>
</tr>
</thead>
<tbody>
<tr>
<td>B(_{\text{max}}) = 13,5 mm</td>
<td>16,0 mm</td>
</tr>
<tr>
<td>B(_{\text{min}}) = 10,5 mm</td>
<td>12,0 mm</td>
</tr>
</tbody>
</table>

- Close the inspection port on the cooling air duct
- Mount the protective grid on the cooling air outlet
- Mount the acoustic enclosure
- Check the electrical connection
- Make sure that the electrical connection of the temperature monitoring is undamaged

**Version with equipotential bonding of the fan cover:**
- Make sure that the earth cable on the fan cover is undamaged (resistance check)

**Version with ATEX-inlet air filter (with equipotential bonding):**
- Make sure that the earth cable on the inlet air filter housing is undamaged (resistance check)

**Version with vacuum relief valve with air filter and equipotential bonding:**
- Make sure that the earthing cable on the air filter housing before the vacuum relief valve is undamaged (resistance check)

**Every Year:**
- Make sure that the compressor is shut down and locked against inadvertent start up

In case an inlet air filter is installed:
- Replace the inlet air filter
- Check the inlet screen, clean if necessary

**Version with vacuum relief valve with inlet air filter:**
- Replace the inlet air filter of the vacuum relief valve
- Check the function of the measurement and safety instrumentation (➔ page 14: Functional Check of the Measurement and Safety Instrumentation)

**Every 5000 Operating Hours, At the Latest after 2 Years**

In case of higher requirements in terms of gas tightness:
- Replace the shaft seal rings (Busch service)

**Every 10000 Operating Hours, At the Latest after 2 Years**

**DANGER**

In case the compressor conveyed gas that was contaminated with foreign materials which are dangerous to health, harmful material can reside in the pressure relief lines (r).

Danger to health during blowing out the pressure relief lines.

Danger to the environment.

Wear personal protective equipment while handling contaminated pressure relief lines.

Collect deposits from the pressure relief lines and dispose of them in compliance with applicable regulations.

In order to check the pressure relief lines:
- Undo the fittings between the pressure relief lines and the collecting line (➔ illustration)

- Undo the fitting between the collecting line and the gas discharge and remove the collecting line
- Blow out the collecting line with pressurised air
- Pierce the connection for the collection line at the gas discharge

**Every 5000 Operating Hours, At the Latest after 2 Years**

- Remove the eye bolt (h, 615)
- Remove the lid (424)
• Remove the screw plugs of the pressure relief lines and connect the pressurised air lines (illustration)

every 20000 operating hours, at the latest after 6 years:
• have a major overhaul on the compressor (busch service)

checking the function of the measurement and safety instrumentation
(version with temperature monitoring only)

• disconnect the white cable from pin 3, the first red cable from pin 5 and the second red cable from pin 6
• in order to simulate the resistance thermometer Pt100 set a variable ohmic resistance to approx. 100 Ω
• connect the variable ohmic resistance with 3 identical cables to the pins 3, 5 and 6 of the temperature transmitter as shown in the sketch (the cable connected to pin 5 compensates the cable resistance)

• switch on the compressor
• increase the ohmic resistance to the resistance at shutdown temperature according to the equipment documentation measurement and safety instrumentation (page 19)
• make sure that an alarm is released in the system control and the compressor is shut down automatically
• decrease the ohmic resistance to a value less than the shutdown point
• make sure that the alarm persists
• make sure that the compressor does not start self-acting
• switch on the compressor again
• interrupt the ohmic resistance
• make sure that a fault indication is released in the system control and the compressor is shut down automatically
• reconnect the variable ohmic resistance
• switch on the compressor again
• short circuit the variable ohmic resistance
• make sure that a fault indication is released in the system control and the compressor is shut down automatically
• remove the short circuit
• remove the variable ohmic resistance
• reconnect the resistance thermometer Pt100 to the temperature transmitter (white cable to pin 3, first red cable to pin 5, second red cable to pin 6, sketch)

• firmly close the temperature measurement system (g) with the lid

warning
risk of electrical shock, risk of damage to equipment.

electrical installation work must only be executed by qualified personnel that knows and observes the following regulations:
- IEC 364 or CENELEC HD 384 or DIN VDE 0100, respectively,
- IEC-Report 664 or DIN VDE 0110,
- BGV A2 (VBG 4) or corresponding national accident prevention regulation.

• make sure that the compressor aspirates inert gases and that there are no potentially explosive atmospheres in the environment
• open the lid of the temperature measurement system

CAUTION
Pressurised air supply systems supply a too high pressure.
Risk of damage to the compressor.
Adjust the pressurised air to 0.2 barg by means of a pressure regulator.

• apply 0.2 barg to the pressure relief lines
• check that both pressure relief lines pass the pressurised air
in case one or both pressure relief line is/are clogged:
  • remove the compressor from service and have it repaired (busch service)
  • reconnect the collecting line to the gas discharge and to the pressure relief lines
  • reinsert the screw plugs, remount the lid (424) and the eyebolt (h, 615)
Overhaul

**WARNING**

Improper work on the compressor puts the operating safety at risk.

Risk of explosion!

Approval for operation will be void!

Any dismantling of the compressor that is beyond of what is described in this manual must be done by specially trained Busch service personnel only.

**DANGER**

In case the compressor conveyed gas that was contaminated with foreign materials which are dangerous to health, harmful material can reside in pores, gaps and internal spaces of the compressor.

Danger to health during dismantling of the compressor.

Danger to the environment.

Prior to shipping the compressor shall be decontaminated as good as possible and the contamination status shall be stated in a “Declaration of Contamination” (form downloadable from www.busch-vacuum.com).

Busch service will only accept compressors that come with a completely filled in and legally binding signed “Declaration of Contamination” (form downloadable from www.busch-vacuum.com).

---

Removal from Service

**Temporary Removal from Service**

- Prior disconnecting pipes/lines make sure that all pipes/lines are vented to atmospheric pressure

**Recommissioning**

- Observe the chapter Installation and Commissioning (⇒ page 6)

**Dismantling and Disposal**

**DANGER**

In case the compressor conveyed gas that was contaminated with foreign materials which are dangerous to health, harmful material can reside in pores, gaps and internal spaces of the compressor.

Danger to health during dismantling of the compressor.

Danger to the environment.

During dismantling of the compressor personal protective equipment must be worn.

The compressor must be decontaminated prior to disposal.

- Drain the oil
- Make sure that materials and components to be treated as special waste have been separated from the compressor
- Make sure that the compressor is not contaminated with harmful foreign material

According to the best knowledge at the time of printing of this manual the materials used for the manufacture of the compressor involve no risk.

- Dispose of the used oil in compliance with applicable regulations
- Dispose of the compressor as scrap metal
### Troubleshooting

**WARNING**
Compressor for use in potentially explosive atmospheres.
The compressor must only be operated in faultless condition.
Risk of explosion in case of operation of faulty equipment!
A faulty compressor must immediately be removed from service.
In case of faults the cause of which cannot be determined the Busch service must be contacted.

**WARNING**
Risk of electrical shock, risk of damage to equipment.
Electrical installation work must only be executed by qualified personnel that knows and observes the following regulations:
- IEC 364 or CENELEC HD 384 or DIN VDE 0100, respectively,
- IEC-Report 664 or DIN VDE 0110,
- BGV A2 (VBG 4) or corresponding national accident prevention regulation.

**CAUTION**
During operation the surface of the compressor may reach temperatures of more than 70 °C.
Risk of burns!
Let the compressor cool down prior to a required contact or wear heat protection gloves.

**Brief description:**

The device is fed with a voltage between 14.5 and 45 V DC (between 14.5 and 27.3 V DC in intrinsically safe circuits). The positive pole of the supply is connected to pin 1, the negative pole to pin 3.

Depending on the pressure signal the current between pin 3 and the negative pole of the supply varies between 4 mA (corresponding to -1 barg in factory setting) and 20 mA (corresponding to +1 barg in factory setting).

If required two switching points can be evaluated by means of the pins 4 and 2 and the state of the switches be read on the LEDs S1 and S2.

More installation notes:

The pressure switch/indicator is to be integrated into the system control such that the maintenance of the permitted pressure range* will be monitored. If the pressure gets outside this range the system control must automatically shut down the compressor.

*ambient pressure +200 hPa (=mbar), unless specified otherwise on the nameplate of the compressor

Observe the separate Documentation.

A matching coupling for the connection of a cable to the pressure switch/indicator is included in the scope of delivery of the compressor.

Pin 1 transmits the sum of the currents of the pins 2, 3 and 4. The monitoring circuitry shall be designed such that the current and the voltage allowed for intrinsically safe circuits will not be exceeded on any wire at any time.

Switching options (examples):

1. Use of isolation switch amplifiers (e.g. Pepperl+Fuchs KF__.SR2-Ex1.W; not in the Busch scope of delivery) switched between the pins 1, 2 and 4 of the pressure switch/indicator on the one side and the switching relays on the other.

2. Evaluation of the 4 ... 20 mA signal of the pressure switch/indicator alone, by means of a suitable transmitter supply (e.g. Pepperl+Fuchs KF__.CRG-Ex1.D; not in the Busch scope of delivery).

3. Evaluation of the 4 ... 20 mA signal of the pressure switch/indicator alone, after isolation by means of a suitable transmitter supply (e.g. ACS ExTV650, Pepperl+Fuchs KFD2-STC4-Ex1; not in the Busch scope of delivery), by means of a non-Ex-system control or SPS respectively.

The pressure switch/indicator is to be integrated into the system control such that the maintenance of the pressure range from -200 mbarg to +200 mbarg (corresponding to a current between 10.4 and 13.6 mA, if the factory set measurement range is retained) will be monitored. If the pressure gets outside this range the system control must automatically shut down the compressor. The restart of the compressor is permitted only by action from the operating personnel after remedy of the cause of the excessive pressure.

Appendix: EC declaration of conformity

Declarations of conformity can be found online at www.wika.com.
1. General information

- The instrument described in the operating instructions has been designed and manufactured using state-of-the-art technology. All components are subject to stringent quality and environmental criteria during production. Our management systems are certified to ISO 9001 and ISO 14001.
- These operating instructions contain important information on handling the instrument. Working safely requires that all safety instructions and work instructions are observed.
- Observe the relevant local accident prevention regulations and general safety regulations for the instrument's range of use.
- The operating instructions are part of the instrument and must be kept in the immediate vicinity of the instrument and readily accessible to skilled personnel at any time.
- Skilled personnel must have carefully read and understood the operating instructions, prior to beginning any work.
- The manufacturer's liability is void in the case of any damage caused by using the product contrary to its intended use, non-compliance with these operating instructions, assignment of insufficiently qualified skilled personnel or unauthorised modifications to the instrument.
- The general terms and conditions, contained in the sales documentation, shall apply.
- Subject to technical modifications.

Explanation of symbols

WARNING!
... indicates a potentially dangerous situation that can result in serious injury or death, if not avoided.

CAUTION!
... indicates a potentially dangerous situation, which can result in light injuries or damage to equipment or the environment, if not avoided.

Information
... points out useful tips, recommendations and information for efficient and trouble-free operation.

1. General information / 2. Safety

WARNING!
... indicates a potentially dangerous situation in a potentially explosive atmosphere, resulting in serious injury or death, if not avoided.

WARNING!
... indicates a potentially dangerous situation, caused by hot surfaces or liquids, that can result in burns if not avoided.

Abbreviations
RTD = Resistance Temperature Detector
TC = Thermocouple

2. Safety

WARNING!
Before installation, commissioning and operation, ensure that the appropriate thermometer has been selected in terms of measuring range, design and specific measuring conditions.

Choose the thermowell with regard to the maximum pressure and temperature (e.g. rating chart in DIN 43772).

Non-observance can result in serious injury and/or damage to equipment.

Further important safety instructions can be found in the individual chapters of these operating instructions.

2.1 Intended use
These resistance thermometers and thermocouples are used for temperature measurement in industrial applications, in hazardous areas.

Resistance thermometers are used for measuring temperatures from -200 ... +600 °C. For thermocouples, the possible measuring ranges range from -200 ... +1,200 °C. Thermometers of this design can be installed directly in the process as well as in thermowells. The thermowell designs can be selected as desired, but the operating process data (temperature, pressure, density and flow rate) must be taken into account.
2. Safety

2.1. Personal Qualification

WARNING
Risk of injury should qualification be insufficient.
Improper handling can result in considerable injury and damage to equipment.

The manufacturer shall not be liable for any type based on operation contrary to the intended use.

The instrument shall not be transported from a cold to a warm environment, as the formation of condensation may result in the instrument malfunctioning. Before putting it back into operation, the instrument shall be exposed to the ambient temperature for at least 1 hour.

2.4. Special Hazards

The system operator is responsible for selecting the thermometer or thermometer, and for the maintenance and repair of the instrument. The instrument shall be operated in accordance with the instructions provided by the manufacturer.

2.5. Additional safety instructions for instruments per ATEX and IECEx

WARNING
Non-compliance of these instructions and their contents may result in the loss of explosion protection.
2. Safety

2.5 Labelling, safety marks

2.5.1 Product labels for resistance thermometers

Product label for measuring insert TR10-A

Additional data for Ex instruments

Explanation of symbols

CE, Communauté Européenne
Instruments bearing this mark comply with the relevant European directives.

ATEX European Explosion Protection Directive
(Assumption = AT, exploisible = EX)
Instruments bearing this mark comply with the requirements of the European Directive 94/9/EC (ATEX) on explosion protection.

3. Specifications

3.1 Resistance thermometer

Sensor connection method
- 2-wire
- 3-wire
- 4-wire

Limiting error of the sensor per DIN EN 60751
- Class B
- Class A
- Class AA

The combination of a 2-wire connection with class A or class AA is not permissible, since the lead resistance of the measuring insert negates the higher sensor accuracy.

Basic values and limiting errors
Basic values and limiting errors for the platinum measurement resistances are laid down in DIN EN 60751.

The nominal value of Pt100 sensors is 100 Ω at 0 °C.

The temperature coefficient α can be stated simply to be between 0 °C and 100 °C with:

\[ \alpha = 3.95 \times 10^{-3} \text{°C}^{-1} \]

The relationship between temperature and electrical resistance is described by polynomials, which are also defined in DIN EN 60751. Moreover, this standard specifies the basic values in °C steps in tabular form.

1) [1] is the value of the temperature in °C irrespective of the sign.
2) The greater value applies.

There are differentiations of type K thermocouples in Europe and North America:

Europe: NCR-Ni or NCL-Ni
North America: Ni-Cr / Ni-AL

There is no physical difference, it is just the naming caused by historical reasons.

3.2.2 Potential measurement uncertainties

Important factors which counteract the long-term stability of thermocouples.

Ageing effects/poisoning

- Oxidation processes in thermocouples which are not appropriately protected (bare thermocouple wires) result in falsifications of the characteristic curves.
- Foreign atoms (poisoning) that diffuse into the original alloy lead to changes of these original alloys and thus falsify the characteristic curve.
- The influence of hydrogen leads to the embrittlement of the thermocouples.

The Ni leg of the type K thermocouple is often damaged by sulphur which is contained in exhaust gases, for example. Thermocouple types J and T age slightly, as the pure metal leg oxidises first.

In general, rising temperatures cause accelerated ageing effects.

Green rot

If type K thermocouples are used at temperatures from approx. 600 °C to 1,050°C, considerable changes of the thermoelectric voltage can occur. This causes a chromium depletion or the chrome oxidation in the NiCr leg (+ leg). The precondition for this is a low concentration of oxygen or steam in the immediate environment of the thermocouple. The nickel leg is not affected by it. The consequence of this effect is a drift of the measured value caused by decreasing thermoelectric voltage. This effect is accelerated if there is a shortage of oxygen (reducing atmosphere), since a complete oxide layer, which would protect it from further oxidation of the chromium, cannot be formed on the surface of the thermocouple.

The thermocouple is permanently destroyed by this process. The name green rot is derived from the greenish tarnishing coloration on the breaking point of the wire.
3. Specifications

The thermocouple type N has in this regard an advantage due to its silicon content. Here, a protective oxide layer forms on its surface under the same conditions.

K effect

The NiCr leg of a type K thermocouple has an ordered alignment with respect to the alignment in the crystal lattice below approx. 400 °C. If the thermocouple is heated further, a transition to a disordered state occurs in the temperature range between approx. 400 °C and 600 °C. Above 600 °C, an ordered crystal lattice is restored.

If these thermocouples cool too quickly (quicker than approx. 100 °C per hour), the undesirable disordered crystal lattice occurs again during cooling in the range from approx. 600 °C to approx. 400 °C. In the characteristic curve of type K, however, a consistently ordered alignment state is assumed and provided with values. This results in a fault of the thermoelectric voltage of up to approx. 0.6 mV (approx. 5 °C) in this range. The K effect is reversible and is largely eliminated again by annealing above 700 °C, followed by correspondingly slow cooling.

Thin sheathed thermocouples are particularly sensitive in this respect. Cooling in a freestanding state can already lead to deviations of 1 K.

In type N thermocouples, it has been possible to reduce this short-range-order effect by alloying both legs with silicon.

The application range of these thermometers is limited both by the permissible maximum temperature of the thermocouple and by the maximum temperature of the thermowell material.

Listed models are available both as single or dual thermocouples. The thermocouple will be delivered with an insulated measuring point, unless explicitly specified otherwise.

Tolerance value

For the tolerance value of thermocouples, a cold junction temperature of 0 °C has been taken as the basis. When using a compensating cable or thermocouple cable, an additional measuring error must be considered.

For limiting deviations and further specifications, see the corresponding WIKA data sheet and Technical Information IN 03.25, “Application of thermocouples.”

4. Design and function

4.1 Description

These thermometers (resistance thermometers and thermocouples) detect temperatures in processes. Depending on their design, these thermometers are suitable for low, medium and high process requirements in hazardous areas.

Insulated measuring point

The model TRox or model TCx thermometers consist of a welded tube, a mineral-insulated sheathed cable or ceramic-insulated thermal wires (in which the temperature sensor is located, embedded in a ceramic powder), a temperature-resistant sealing compound, cement compound or a thermal transfer paste.

Alternatives:

The measuring insert or the cable probe can also be provided in a tubular form. In this case, the sensor is located in a welded tube and embedded in a ceramic powder, heat-conducting paste or in a sealing compound suitable for this purpose.

The measuring insert for high-temperature thermocouples can also be assembled from thermal wires insulated with ceramic rods or ceramic beads. The ceramic tube is cemented into a metallic support tube using a temperature-resistant cement.

Thermocouples, non-insulated (grounded)

For special applications, for example, surface temperature measurements, the sensors are in direct contact with the protective sleeve, or the measuring points of thermocouples are welded to the bottom (see chapter 7.1.1 “Special conditions of use (X conditions).”)

Measuring point insulated (ungrounded) Measuring point not insulated (grounded)

MI line

14 WIKA operating instructions RTD and TC, intrinsically safe designs (Ex i)
4. Design and function / 5. Transport, packaging and storage

Vibration resistance
The thermometers have an impact- and vibration-resistant design. The vibration resistance of the basic model corresponds to DIN EN 60751 (up to 3 g), while for special designs higher loads are possible. The impact resistance of all versions complies with the requirements of EN 60751, with the exception of high-temperature thermocouples assembled from ceramic-insulated thermal wires.

Electrical connection
In terms of connection, the thermometer is equipped with a housing and a connector or bare wire ends. The housing design will contain the terminals or a certified transmitter. Optionally, separately-certified digital displays can be built into the housing.

4.3 Scope of delivery
Cross-check scope of delivery with delivery note.

5. Transport, packaging and storage

5.1 Transport
Check instrument for any damage that may have been caused by transport.
Obvious damage must be reported immediately.

5.2 Packaging
Do not remove packaging until just before mounting.
Keep the packaging as it will provide optimum protection during transport (e.g. change in installation site, sending for repair).

5.3 Storage
Permissible conditions at the place of storage:
- Storage temperature:
  - Instruments without built-in transmitter: -40 ... +85 °C
  - Instruments with built-in transmitter: see operating instructions of the transmitter in question
- Humidity: 35 ... 85 % relative humidity (no condensation)

Avoidance of exposure to the following factors:
- Direct sunlight or proximity to hot objects
- Mechanical vibration, mechanical shock (putting it down hard)
- Stool, vapour, dust and corrosive gases

5. Transport, packaging and storage / 6. Commissioning, operation

Store the instrument in its original packaging in a location that fulfills the conditions listed above. If the original packaging is not available, pack and store the instrument as described below:
1. Wrap the instrument in an antistatic plastic film.
2. Place the instrument, along with shock-absorbent material, in the packaging.
3. If stored for a prolonged period of time (more than 30 days), place a bag, containing a desiccant, inside the packaging.

WARNING!
Before storing the instrument (following operation), remove any residual media. This is of particular importance if the medium is hazardous to health, e.g. caustic, toxic, carcinogenic, radioactive, etc.

6. Commissioning, operation

WARNING!
When the thermometer is mounted, the temperature must not drop below the allowed operating temperature (environment, medium) or exceed it, even when taking convection and heat radiation into account!

WARNING!
Thermometers must be earthed if dangerous voltages could be expected at the connection wires (caused, for example, by mechanical damage, electrostatic discharge or induction!)

6.1 Electrical connection
CAUTION!
- Damage to cables and wires, and to connection points, must be avoided
- Provide finely stranded conductor ends with end splices (cable assembly)
- Both the internal capacitance and inductance must be considered

For the electrical connections of thermometers (e.g. connection circuit diagrams, tolerance values, etc.), please refer to the appropriate data sheets. If head transmitters or digital displays have been built into the connection housing, these data sheets must also be given proper consideration.

6.4 Multipoint thermocouples (as per 8.4)

They are usually equipped with a housing in which transmitters or terminal blocks are mounted. The transmitters/digital displays are fastened mechanically (e.g. rail system in housing or holder in connection head) and installed in accordance with EN/IEC 60079-11 and EN/IEC 60079-14. Optionally, depending on design, the housing can be equipped with or without terminals (e.g. terminal blocks, etc.) in accordance with EN/IEC 60079-11 and EN/IEC 60079-14.

When using several transmitters/digital displays, the housing volume increases as a function of the "heat source", thus increasing the volume to be heated. This guarantees that the housing surface temperature does not increase significantly.

WARNING
When using no terminals and line wiring, compliance with the installation regulations in accordance with EN/IEC 60079-11 and EN/IEC 60079-14 must be guaranteed.

6.5 Cable glands

In thermometers equipped with connection heads, the cable glands must be fully sealed in order to ensure that the necessary ingress protection is reached.

Requirements for meeting ingress protection:
- Only use cable glands within their indicated clamping range (cable diameter suitable for the cable gland)
- Do not use the lower clamping area with very soft cable types
- Only use circular cross-section cables (if necessary, slightly oval in cross-section)
- Do not twist the cable
6. Commissioning, operation

- Repeated opening/closing is possible, however only if necessary, as it might have a detrimental effect on the protection class.
- For cable with a pronounced cold-flow behaviour, the screw connection must be fully tightened.

6.5 Parallel threads

If the thermometer connecting head, extension neck, thermowell or process connection are connected with parallel threads (e.g. G 1/4", M20 x 1.5...), these threads must be secured using seals which prevent liquids from penetrating into the thermometer.

As standard, WIKA uses copper profile seals for the connection between the neck tube and the thermowell, and flat paper seals for the connection of the connection head and the extension neck or thermowell.

If the thermometer and the thermowell are already connected, the seals will already be mounted. The plant operator must check whether the seals are suitable for the operating conditions and must replace them, if necessary, with suitable seals.

For thermometers without a thermowell, and/or when these are delivered separately, the seals are not included and must be ordered separately.

Tighten the threads by hand when carrying out the final assembly on the plant. This will correspond to the delivery status of the pre-mounted components. The final tightening torque should be applied using a spanner (half revolution).

⚠️ The seals must be replaced after dismantling!

The seals can be ordered from WIKA, indicating the WIKA order number and/or the designation (see table).

6.7 Tapered threads (NPT)

Connections with tapered threads (NPT) are self-sealing and normally must not be sealed. It should be checked whether it may be necessary to seal them additionally with PTFE tape or hemp. The threads must be lubricated with a suitable lubricant before fitting.

Tighten the threads by hand when carrying out the final assembly on the plant. This will correspond to the delivery status of the pre-mounted components. The final tightening and sealing must be made with a spanner (1.5 to 3 rotations).

7. Information on mounting and operation in hazardous area (Europe)

**WARNING!**

In hazardous areas the use of a model TR10-A measuring insert without a suitable connection head (case) is not permissible. Where required a suitable thermowell is to be used.

7.1 General information on explosion protection

The requirements of the 94/9/EC (ATEX) directive must be followed. Additionally the specifications of the respective national regulations concerning Ex usage apply.

A) The responsibility for classification of zones lies with the plant operator and not the manufacturer/supplier of the equipment.

B) The plant operator guarantees, and is solely responsible, that all thermometers in use are identifiable with respect to all safety-relevant characteristics. Damaged thermometers may not be used. Repairs may only be completed using original spare parts from the original supplier; otherwise the requirements of the approval are not fulfilled.

The manufacturer shall not be responsible for constructional modifications after delivery of the instruments.

C) If a component of electrical equipment, on which the explosion protection depends, is repaired, then the electrical equipment may only be put back into use, after an authorised expert has stated that it corresponds to the fundamental characteristics of the requirements for explosion protection. In addition this expert must provide a certificate for this and provide the equipment with a test mark.

D) Item C) shall not apply if the component was repaired by the manufacturer in accordance with the requirements and regulations.
7. Information on mounting, operation in hazardous area (Europe)

E) When using transmitters and digital displays, the following must be observed:

- The contents of these operating instructions and those of the transmitter.
- The relevant regulations for installation and use of electrical systems.
- The regulations and directives regarding explosion protection. Transmitters and digital displays must have their own approval.

F) When ordering spare parts, the parts that are to be replaced must be specified exactly:
- Ignition protection type (here Ex i)
- Approval No.
- Order No.
- Manufacturing No.
- Order Item

7.1 Special conditions of use (X conditions)

7.1.1 Special conditions of use (X conditions)

Versions with \( \Theta < 3 \) mm or "non-insulated" versions are operationally non-compliant with section 6.3.12 of EN/IEC 60079-11. Therefore, from a safety-related point of view, these intrinsically safe circuits must be considered galvanically connected to the earth potential, which is why equipotential bonding must be secured for the entire installation of the intrinsically safe circuits. In addition, for the connection, separate conditions in accordance with EN/IEC 60079-14 must be observed.

- Electrostatic discharges must be avoided in instruments, that due to their design, do not conform to the electrostatic requirements in accordance with EN/IEC 60079-0.

- The transmitters and digital displays used must have their own EN/IEC approval. The installation conditions, electrical connected loads, temperature classes or maximum surface temperatures for use in potentially explosive dust atmospheres and permissible ambient temperatures can be seen from the relevant approvals and must be observed.

- Thermal backflow from the process, that exceeds the permissible ambient temperature of the transmitter, must not be allowed to occur. It must be prevented by installing suitable heat insulation or a neck tube of suitable length.

- If the wall thickness is below 1 mm, the instruments must not be subjected to ambient stresses that may have an adverse effect on the portion wall. Alternatively, a thermowell of suitable minimum wall thickness may be used.

- When using a thermowell/neck tube, the overall instrument must be designed such that it allows installation in a way that results in a sufficiently tight gap (P 67) or a flameproof gap (EN/IEC 60079-1) towards the less hazardous area.

- When housings are used, they must either have their own suitable approval or comply with the minimum requirements. IP protection: at least IP 20 (at least IP 65 for dust), applies to all housings. However, light metal housings must be suitable in accordance with EN/IEC 60079-0 Section 8.1. In addition, non-metallic housings or powder-coated housings must meet the requirements of EN/IEC 60079-0 or have a suitable warning note.

Table 1

</tr>
</tbody>
</table>

1) The values in brackets apply to special designs. These sensors are manufactured using special sealing compounds. Moreover, they feature housings made of stainless steel and cable glands for low-temperature ranges.

When there is a built-in transmitter and/or a digital display, the special conditions from the type examination certificate (see item 17) apply.
7. Information on mounting, operation in hazardous area (Europe)

Use in methane atmospheres
Owing to the higher minimum ignition energy of methane, the instruments can also be used where methane causes a potentially explosive atmosphere. The instrument can be optionally marked with IIC + ChA.

For applications that require EEx IIC or IIB, instruments with 'ia' marking may also be used in measuring circuits of type 'ib'.

7.2 Temperature class classification, ambient temperatures

The permissible ambient temperatures depend on the temperature class, the housings used and any transmitters and/or digital displays fitted as options.

When a transmitter is connected to a transmitter and/or a digital display, the lowest value of either the ambient temperature limits or the highest temperature class will apply. The lower temperature limit is -40 °C and -50 °C for special designs.

Where there are neither transmitters nor digital displays mounted within the housing, these will also be no additional warming.

With a built-in transmitter (optionally with digital display), heating caused by the operation of the transmitter or digital display may occur.

For applications without transmitters (digital displays) that require Group II instruments (potentially explosive gas atmospheres), the following temperature class classification and ambient temperature ranges apply:

<table>
<thead>
<tr>
<th>Temperature class</th>
<th>Ambient temperature range (Ta)</th>
</tr>
</thead>
<tbody>
<tr>
<td>T6</td>
<td>(-50) -40 ... +80 °C</td>
</tr>
<tr>
<td>T5</td>
<td>(-50) -40 ... +85 °C</td>
</tr>
<tr>
<td>T4, T3</td>
<td>(-50) -40 ... +100 °C</td>
</tr>
</tbody>
</table>

See and observe the permissible ambient temperatures and surface temperatures for third-party products from the relevant approvals and/or data sheets.

Example

For instruments fitted with a DIH10 transmitter and digital display, for example, the following limit for temperature class classification applies:

<table>
<thead>
<tr>
<th>Temperature class</th>
<th>Ambient temperature range (Ta)</th>
</tr>
</thead>
<tbody>
<tr>
<td>T6</td>
<td>-40 ... +80 °C</td>
</tr>
</tbody>
</table>

For applications that require Group II instruments (potentially explosive dust atmospheres), the following surface temperatures and ambient temperature ranges apply:

<table>
<thead>
<tr>

<th>Ambient temperature range (Ta)</th>
</tr>
</thead>
<tbody>
<tr>
<td>750 mW</td>
<td>(-50) -40 ... +40 °C</td>
</tr>
<tr>
<td>650 mW</td>
<td>(-50) -40 ... +70 °C</td>
</tr>
<tr>
<td>550 mW</td>
<td>(-50) -40 ... +100 °C</td>
</tr>
</tbody>
</table>

See and observe the permissible ambient temperatures and surface temperatures for third-party products from the relevant approvals and/or data sheets.

Wika operating instructions RTD and TC, intrinsically safe designs (Ex ia)
7. Information on mounting, operation in hazardous area (Europe)

7.3.2 Increasing the separation of the connection components and hot surfaces
The neck distance (N) is defined as the distance between the lower edge of the connection head (or the housing) to the heat-emitting surface. The temperature to be expected at the lower edge of the connection head or housing is, at most, 100 °C. The conditions for built-in transmitters or displays must be observed. If required, the neck length must be increased accordingly.

For thermometers fitted with a connection head, the temperature at the interface with the connecting cable is restricted. The maximum is 150 °C. To ensure that the permissible temperature is not exceeded, the dimension X must be selected accordingly.

<table>
<thead>
<tr>
<th>Maximum temperature of the medium</th>

<td>50 mm</td>
</tr>
<tr>
<td>&gt; 200 °C or up to 450 °C</td>
<td>100 mm</td>
<td>100 mm</td>
</tr>
</tbody>
</table>

**WARNING!**
For reasons of work safety and saving of resources, hot surfaces should be protected against accidental touch and energy loss by means of insulation.

7.4 Mounting examples in hazardous areas

7.4.1 Possible installation methods with the marking II 1G Ex ia IIC T6 Ga or II 1D Ex ia IIC T65 °C Da

WIKA operating instructions RTD and TC, intrinsically safe designs (Ex i)
7. Information on mounting, operation in hazardous area (Europe)

The sensor together with housing or connection head is located in Zone 0 (Zone 20). An Ex ia type circuit must be used. Connection heads/cases made of aluminium are not permitted in zone 0. At this position, WIKA uses connection heads/cases made of stainless steel.

7.4.2 Possible installation methods with the marking II 1/2 Ex ib IIC T6 GaGb or II 1/2 D Ex ib IIC T65°C DaDb

Zones 9, 1, 2 or Zones 20, 21, 22

Process connection

Hazardous area

Safe area

Associated electrical equipment

Intrinsically safe supply or suitable barrier

Option without ex transmitter, eg T6

Thermowell

Compression fitting

Welded

Thermowell

Field housing

Connection head

Intrinsically safe supply or suitable barrier

The sensor or thermowell tip protrudes into Zone 0. The housing or connection head is in Zone 1 (Zone 21) or Zone 2 (Zone 22). It is sufficient to use an Ex ib type circuit.

Zone separation is guaranteed if sufficiently-light (IP 67) process connections are used.

Examples of suitable process connections include gas-tight standardised industrial flanges, threaded connections or pipe connections.

The welded parts, process connections, compression fittings, thermowells or housings used must be designed such that they withstand all influencing variables resulting from the process, such as temperature, flow forces, pressure, corrosion, vibration and impacts.

8. Electrical connection values

8.1 Electrical data without built-in transmitter or digital display

For Group II instruments (potentially explosive gas atmospheres), the following maximum connection values apply:

U = DC 30 V
I = 550 mA
P = (at the sensor) = 1.5 W

For Group II instruments (potentially explosive dust atmospheres), the following maximum connection values apply:

U = DC 30 V
I = 550 mA
P = (at the sensor) = For the values, see "Table 2" (column 2), chapter 7.1.2 "Ex marking"

1) The permissible power to the sensor depends on the temperature of the medium Tm, the temperature class and the thermal resistance Rth, but shall not be more than 1.5 W.

2) For calculation examples, see chapter 9 "Calculation examples for self-heating at the sensor/thermowell tip".

3) Use in methane atmospheres

Owing to the higher minimum ignition energy of methane, the instrument can also be used where methane causes a potentially explosive atmosphere. The instrument can be optionally marked with IIC + CEx ib

The internal inductance (L) and capacitance (C) of standard measuring inserts in accordance with DIN 43735 are negligible. The values for cable probes and very long sheathed-cable/ resistance thermometers can be seen from the rating plate and must be taken into account when connecting them to an intrinsically safe power supply.
8. Electrical connection values

Sensor circuit in Ex ia or ib, IIIC intrinsic safety ignition protection
Only for connection to intrinsically safe circuits with the following maximum output values for
Group II instruments (potentially explosive gas atmospheres):

\[ U_o = DC \ 30 \ \text{V} \]
\[ I_o = 550 \ \text{mA} \]
\[ P_o = 1.5 \ \text{W} \]

For Group II instruments (potentially explosive gas atmospheres), the following maximum output values apply to their connection to intrinsically safe circuits:

\[ U_o = DC \ 30 \ \text{V} \]
\[ I_o = 550 \ \text{mA} \]
\[ P_o = \ \text{For the values, see Table 2 (column 2), chapter 7.1.2 “Ex marking”} \]

8.2 Electrical data for built-in transmitters or digital displays

For the sensor circuit, the values mentioned in 8.1 apply.
Signal circuit in Ex ia or ib, IIIC intrinsic safety ignition protection:

\[ U_o = \ \text{Depending on the transmitter/digital display} \]
\[ I_o = \ \text{Depending on the transmitter/digital display} \]
\[ P_o = \ \text{In the housing: depending on the transmitter/digital display} \]
\[ Q_o = \ \text{Depending on the transmitter/digital display} \]
\[ L_o = \ \text{Depending on the transmitter/digital display} \]

The transmitters and digital displays used must have their own certification in accordance with EN/IEC. The installation conditions and electrical connection values can be seen from the relevant approvals and must be observed.

8.3 Electrical data with built-in transmitters in accordance with the FISCO model

The transmitters/digital displays used for the application range in accordance with the FISCO model are considered FISCO field units. The requirements in accordance with EN/IEC 60079-27, and the connection conditions of the approvals in accordance with FISCO, apply.

8.4 TC5S/TR95 multipoint thermocouples

Assembly of multipoint thermocouples from individual sheathed cables
For the individual insulated sheathed cable, the values mentioned in 8.1 apply. For operationally grounded multipoint thermocouples, the sum of all the sensors must comply with the above-mentioned values. For applications in dust areas, the values from “Table 2” (column 2) given in chapter 7.1.2 “Ex marking” must be observed.

9. Calculation examples for self-heating at the sensor/thermowell tip

The self-heating at the sensor tip or thermowell tip depends on the sensor type (TCARTD), the probe diameter, the thermowell design and the power supplied to the sensor in the event of a failure. The table below shows the possible combinations. The table shows that when a failure occurs, thermocouples produce much less self-heating than resistance thermometers.

1) surface-sensitive

When using multiple sensors or simultaneous operation, the sum of the individual powers must not exceed the value of the maximum permissible power. The maximum permissible power must be limited to 1.5 W maximum. This must be guaranteed by the plant operator.

9.1 Calculation example for RTD measuring point with thermowell

Use at the partition wall to Zone 0: Calculate the maximum permissible temperature \( T_{\text{max}} \) at the thermowell tip for the following combination:

- RTD measuring (insert 6 mm) with built-in model T32.1S head-mounted transmitter, fitted into a Design 3F multi-part thermowell.
- Power supply, for example, via a Model KFD2-STC4-EX1 transducer power supply (WIKA article No. 234128).

\( T_{\text{max}} \) is obtained by adding the temperature of the medium and the self-heating. The self-heating of the thermowell tip depends on the supplied power \( P_o \) of the transmitter and the thermal resistance \( R_m \).

The formula used for the calculation:

\[ T_{\text{max}} = P_o \times R_m + T_m \]

\( T_{\text{max}} \) = Surface temperature (max. temperature at the thermowell tip)
\( P_o \) = from transmitter data sheet
\( R_m \) = Thermal resistance [K/W]
\( T_m \) = Temperature of the medium

Prerequisite is an ambient temperature \( T_{\text{ambient}} \) of -20 ... +40 °C.
9. Calculation examples for self-heating at the sensor/thermowell tip

Example
Resistivity thermometer RTD
Diameter: 6 mm
Temperature of the medium $T_M = 150^\circ C$
Supplied power: $P_0 = 15.2 \text{ mW}$
Temperature Class T3 (200 $^\circ C$) must not be exceeded

Thermal resistance $[\text{Rh} \text{ in K/W}]$ from table = 37 K/W
Self-heating: $0.0152 \times 37 \text{ K/W} = 0.56 \text{ K}$
$T_{\text{max}} = T_M + \text{Self-heating}; 150^\circ C + 0.56^\circ C = 150.56^\circ C$

The result shows that in this case self-heating at the thermowell tip is negligible. As safety clearance for type-examined instruments (for T6 to T3), another 5 $^\circ C$ must be subtracted from the 200 $^\circ C$; hence 195 $^\circ C$ would be permissible. This means that in this case temperature class T3 is not exceeded.

Additional information
Temperature class for T3 = 200 $^\circ C$
Safety clearance for type-examined instruments (T6 to T3) $^1 = 5 \text{ K}$
Safety clearance for type-examined instruments (T1 to T2) $^1 = 10 \text{ K}$

1) EN 60 79-0: 2009 Section 26.5.1

Simplified verification of intrinsic safety for the above-mentioned combination

<table>
<thead>
<tr>
<th>Measuring insert</th>
<th>Head transmitter</th>
<th>Power supply</th>
</tr>
</thead>
<tbody>
<tr>
<td>$U_0$: DC 30 V</td>
<td>$I_0$: 2.3 mA</td>
<td>$I_C$: 0.19 mA</td>
</tr>
<tr>
<td>$P_0$: 15.2 mW</td>
<td>$P_0$: 150 mW</td>
<td>$P_0$: 93 mW</td>
</tr>
<tr>
<td>$C_0$: 24 $\mu\text{F}$</td>
<td>$C_0$: 93 $\mu\text{F}$</td>
<td>$C_0$: 93 $\mu\text{F}$</td>
</tr>
<tr>
<td>$L_0$: 365 mH</td>
<td>$L_0$: 100 mH</td>
<td>$L_0$: 27 mH</td>
</tr>
</tbody>
</table>

Upon comparing the values, it is obvious that it is permissible to connect these units to one another. However, the operator must also take into account the values for inductance and capacitance of the electrical connection leads.

9.2 Calculation example for a sheathed cable with RTD sensor

Use at the partition wall to Zone 0: Calculate the maximum permissible temperature $T_{\text{max}}$ at the probe tip for the following combination:

Resistance thermometer without thermowell (TR10-1) Ø 6 mm without transmitter, mounted by means of a compression fitting with stainless steel sealing ring. Power supply is, for example, via a model 2354 Zener barrier (WIKA Article No. 3047936), for example.

$T_{\text{max}}$ is obtained by adding the temperature of the medium and the self-heating. The self-heating of the thermowell tip depends on the supplied power $P_0$ of the Zener barrier and the thermal resistance $\text{Rh}$.

WIIKAn operating instructions RTD and TC, intrinsically safe designs (Ex i) 3
9. Calculation examples for ... / 10. Maintenance and cleaning

Simplified verification of intrinsic safety for the above-mentioned combination

<table>
<thead>
<tr>
<th>Measuring insert</th>
<th>Zener barrier 2954</th>
<th>Display instrument (not hazardous area)</th>
</tr>
</thead>
<tbody>
<tr>
<td>U₀ DC 30 V</td>
<td>U₀ DC 9 V</td>
<td>U₀ AC 230 V</td>
</tr>
<tr>
<td>I₀ 550 mA</td>
<td>I₀ 510 mA</td>
<td>I₀ NA</td>
</tr>
<tr>
<td>U₀ (max) at the sensor: 1.3 W</td>
<td>U₀ (max) at the sensor: 1.3 W</td>
<td>U₀ (max) at the sensor: 1.3 W</td>
</tr>
<tr>
<td>C₀ negligible</td>
<td>C₀: 4.9 μF</td>
<td>C₀: RA</td>
</tr>
<tr>
<td>L₀ negligible</td>
<td>L₀ 0.12 mH</td>
<td>L₀ NA</td>
</tr>
</tbody>
</table>

Upon comparing the values, it is obvious that it is permissible to connect these units to one another. However, the operator must also take into account the values for inductance and capacitance of the electrical connection leads.

These calculations apply to the Zener barrier in connection with a resistance thermometer Pt100 in 3-channel mode without grounding, i.e., symmetrical operation of the resistance thermometer in 3-wire circuit on a display or evaluation instrument.

Electrical connection

For sensor connections, terminal, cable or connector assignments, see chapter 6.1 “Electrical connection”.

10. Maintenance and cleaning

10.1 Maintenance

These thermometers are maintenance-free.

Repairs must only be carried out by the manufacturer.

10.2 Cleaning

CAUTION!
- Clean the instrument with a moist cloth. This applies in particular to thermometers with a housing made of plastic and cable probes with plastic-insulated connection lead, to ensure that any risk of electrostatic discharge is avoided.
- Electrical connections must not come into contact with moisture.
- Wash or clean the dismantled instrument before returning it, in order to protect staff and the environment from exposure to residual media.
- Residual media in dismantled instruments can result in risk to persons, the environment and equipment. Take sufficient precautionary measures.

For information on returning the instrument, see chapter 12.2 “Returns”.

<td>Stray currents caused by electric fields or earth loops</td>
<td>Use screened connecting cables, increase in the distance to motors and power lines</td>
</tr>
<tr>
<td></td>
<td>Earth circuits</td>
<td>Eliminate potentials, use galvanically isolated transmitter supply isolators or transmitters</td>
</tr>
</tbody>
</table>

CAUTION!
If deficiencies cannot be eliminated by means of the measures listed above, shut down the instrument immediately, and ensure that pressure and/or signal are no longer present, and secure the instrument from being put back into operation inadvertently. In this case, contact the manufacturer.
Should a return be necessary, please observe the information in chapter 12.2 “Returns”.
12. Dismounting, return and disposal

12. Dismounting, return and disposal

**WARNING!**
Residual media in dismounted instruments can result in a risk to persons, the environment and equipment. Take sufficient precautionary measures.

12.1 Dismounting

**WARNING!**
Risk of burns!
Let the instrument cool down sufficiently before dismounting it. When dismounting it, there is a risk that dangerously hot pressure media may escape.

Connections must only be opened when the instrument is depressurised and has cooled down.

The thermometer or the measuring insert can be removed from the thermowell. The thermowell itself should only be removed from the process once it is in a depressurised state. For thermometers without thermowell, the system must have been depressurised, cooled down and be free of hazardous materials.

12.2 Returns

**WARNING!**
Absolutely observe when shipping the instrument:
All instruments delivered to WIKA must be free from any kind of hazardous substances (acids, bases, solutions, etc.).

To return the instrument, use the original packaging or a suitable transport package.

To avoid damage:
1. Wrap the instrument in an anti-static plastic film.
2. Place the instrument, along with the shock-absorbing material, in the packaging.
3. Place shock-absorbing material evenly on all sides of the shipping box.
4. If possible, place a bag, containing a desiccant, inside the packaging.

Information on returns can be found under the heading “Service” on our local website.

12.3 Disposal

Incorrect disposal may endanger the environment.

Dispose of instrument components and packaging materials in an environmentally compatible way and in accordance with the country-specific waste disposal regulations.

EC-Type Examination Certificate

Certificate Number: TÜV 10 ATEX 555793 X

for the equipment: Thermometer TR... / TC...

of the manufacturer: WIKA Alexander Wiegand SE & Co. KG

Date of issue: 2010-05-18

Order number: 0000557931

The equipment or protective system and any acceptable variations thereto are specified in the schedule to this certificate and the documents therein referred to.

The TÜV NORD CERT GmbH, notified body No. 0494 in accordance with Article 9 of the Council Directive of the EC of March 23, 1964 (94/9EC), certifies that the equipment or protective system has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of equipment and protective systems intended for use in potentially explosive atmospheres, given in Annex II to the Directive. The examination and test results are recorded in the confidential report No. 1023-12557931.

Compliance with the Essential Health and Safety Requirements has been assured by compliance with:

EN 60796-1:2009
EN 60797-11:2007
EN 60796-2:2007
EN 61241-11:2006

If the sign "X" is placed after the certificate number, it indicates that the equipment or protective system is subject to special conditions for safe use specified in the schedule to this certificate.

This EC-type examination certificate relates only to the design, examination, and testing of the specified equipment in accordance to the Directive 94/9EC. Further requirements of the Directive apply to the manufacturing process and supply of this equipment. These are not covered by this certificate.

The marking of the equipment or protective system shall include the following:

Ex iIC Ex ia IIC T3, T4, T5, T6 GaGe resp. I1D G Ex ia IIC T3, T4, T5 T6 GaGe resp.
I1D Ex ia IIC T65°C, T95°C, T125°C D1a
I1D Ex ia IIC T65°C, T95°C, T125°C Da

TÜV NORD CERT GmbH, Langemarckstraße 20, 40474 Düsseldorf, accredited by the central office of the Competence Center for Safety Engineering (ZS3), Idena, Nr. 0344, legal successor of the TÜV NORD CERT GmbH & Co. KG Idena, Nr. 00032

The head of the certification body:

This certificate may only be reproduced without any change, schedule included. Duplicates or copies shall be submitted to the TÜV NORD CERT GmbH

Schedule

EC-Type Examination Certificate No. TÜV 10 ATEX 555793 X

Description of equipment

The thermometer type TR... (resistive sensor) and TC... (thermocouple element) consists of a welded tubing or a mineral-sheathed cable or a ceramic insulated thermo wire, with the temperature sensor inside which is embedded in ceramic powder, in a heat resistant casting compound, a cement compound or a thermal conductance paste. For connection purpose the thermometer may equipped with a plug or a free connecting cable. Other components like an enclosure used as a connection box or a thermometer may be used. A certified transmitter resp. a certified current loop indicator may be placed inside the enclosure.

The compliance with the temperature class and the intrinsic safety of the circuit is assured by an intrinsically safe power supply. The maximum surface temperature at the tip of the probe resp. the thermometer is to be calculated, depending on the applied power, the ambient temperature resp. medium temperature and the thermal resistance. The required values (Rth) are supplied by the manufacturer as a matrix, depending on the probe diameter and the configuration of the probe (see table 3).

The permissible ambient temperatures and depending on the marking of the temperature class, the used enclosure and the installation of an optionally used transmitter and/or a digital display. In this case the special conditions for safe use (17) must be considered. The lower temperature limit is -40 °C; for special models the lower temperature limit is -50 °C.

For the connection of a thermometer and a transmitter and/or a digital display the minor values of the ambient temperature limits and the temperature class with the highest figure is valid.

The pressure and temperature range of explosive atmosphere at the connection side must be for applications which require devices of the category 1 resp. category 1/2 between 0.8 to 1.1 bar and -20 °C to 60 °C. If the thermometer is operated outside these atmospheric conditions this EC-Type Examination Certificate for a device for category 1 resp. category 1/2 is only a guide. Additional tests for the special application conditions are recommended.

The thermometer must be suitable for the thermal and mechanical stress within the process. As the case may be a thermometer with a proper minimum wall thickness may be used.
For applications without transmitter (digital display) which require devices of the group II (explosive gas atmospheres) the following temperature classes, divisions and ambient temperature ranges apply:

<table>
<thead>
<tr>
<th>Marking</th>
<th>Temperature class</th>
<th>Ambient temperature range</th>
<th>Maximum surface temperature (T_{su}) at the tip of the probe or thermowell</th>
</tr>
</thead>
<tbody>
<tr>
<td>II 1 G Ex ia IIC T6 Ga</td>
<td>T6</td>
<td>(-50 °C) to +80 °C</td>
<td>T_{su} (medium temperature) + self-heating. The special conditions for safe use (17) shall be considered.</td>
</tr>
<tr>
<td>II 1 G Ex ia IIC T5 Ga</td>
<td>T5</td>
<td>(-50 °C) to +95 °C</td>
<td></td>
</tr>
<tr>
<td>II 1 G Ex ia IIC T4 Ga</td>
<td>T4, T3</td>
<td>(-50 °C) to +100 °C</td>
<td></td>
</tr>
</tbody>
</table>

For the installation of a transmitter and/or a digital display the special conditions for safe use shall be considered (17).

For applications which require devices of the group II (explosive dust atmospheres) the following surface temperatures and ambient temperature ranges apply:

<table>
<thead>
<tr>
<th>Marking</th>
<th>Power P</th>
<th>Ambient temperature range</th>
<th>Maximum surface temperature (T_{su}) at the tip of the probe or thermowell</th>
</tr>
</thead>
<tbody>
<tr>
<td>II 1 D Ex ia IIC T55 °C Da</td>
<td>750 mW</td>
<td>0 °C to +60 °C</td>
<td>T_{su} (medium temperature) + self-heating. The special conditions for safe use (17) shall be considered.</td>
</tr>
<tr>
<td>II 1 D Ex ia IIC T55 °C Da</td>
<td>650 mW</td>
<td>0 °C to +70 °C</td>
<td></td>
</tr>
<tr>
<td>II 1 D Ex ia IIC T55 °C Da</td>
<td>550 mW</td>
<td>0 °C to +100 °C</td>
<td></td>
</tr>
</tbody>
</table>

For the installation of a transmitter and/or a digital display the special conditions for safe use shall be considered (17).

Technical data

Electrical data without built-in transmitter or digital display

For devices of group II (explosive gas atmospheres) the following maximum connection values apply:

\[ U_{0} = 30 \text{ V} \]
\[ I_{0} = 550 \text{ mA} \]
\[ P_{0} = \text{(at the sensor) } = 1.5 \text{ W} \]

For devices of group II (explosive dust atmospheres) the following maximum connection values apply:

\[ U_{0} = 30 \text{ V} \]
\[ I_{0} = 550 \text{ mA} \]
\[ P_{0} = \text{(at the sensor) } = \text{Values from table 2, column 2} \]

The internal inductance (L) and capacitance (C) of standard measuring inserts according to DIN 43736 are negligibly small. The values for cable probes shall be taken from the type label and shall be considered for the connection to an intrinsically safe power supply.

Sensor circuit in type of protection intrinsic safety Ex ia, or ib, IIC

Only to be connected to intrinsically safe circuits with the following output values for devices of group II (explosive gas atmospheres):

\[ U_{0} = 30 \text{ V} \]
\[ I_{0} = 550 \text{ mA} \]
\[ P_{0} = \text{Values from table 2, column 2} \]

Sensor circuit in type of protection intrinsic safety Ex ia, or ib, IIC

Only to be connected to intrinsically safe circuits with the following output values for group II (explosive dust atmospheres):

\[ U_{0} = 30 \text{ V} \]
\[ I_{0} = 550 \text{ mA} \]
\[ P_{0} = \text{Values from table 2, column 2} \]

For the use of multiple sensors and simultaneous operation the summation of all single power dissipation may not exceed the maximum permissible power dissipation. This shall be considered by the end-user in the end-use application.
Schedule EC-Type Examination Certificate No. TÜV 10 ATEX 555793 X

Electrical data with built-in transmitter or digital display

For the sensor circuit the above specified values corresponding to the group II apply.

Signal circuit in type of protection intrinsic safety Ex ia, or ib, IIC resp. IIIC

\[ U_i = \text{depending on transmitter/digital display} \]

\[ I_i = \text{depending on transmitter/digital display} \]

\[ P_i = \text{inside the enclosure depending on transmitter/digital display} \]

\[ C_i = \text{depending on transmitter/digital display} \]

\[ L_i = \text{depending on transmitter/digital display} \]

The used transmitter/digital display shall be provided with their own EC-Type Examination Certificate in accordance to EN/IEC. The installation conditions and the electrical connection values shall be taken from the corresponding EC-Type Examination Certificate and shall be considered.

Electrical data with built-in transmitter or digital display according to the FISCO model

The used transmitter/digital display for operating conditions according to the FISCO model are considered as FISCO field devices. The requirements according to EN/IEC 60079-27 and the conditions for connection of the EC-Type Examination Certificate for FISCO apply.

Multisensor thermometers

Multipoint built up from several shell elements

For the isolated single element the above specified values are valid. For elements which are considered as grounded due to their construction the specified values apply for the sensors in sum. For use in duct atmospheres the values of table 2, column 2 apply.

Coaxial multi-point thermocouples

The circuits of the coaxial element shall be considered as connected due to their construction. For the application a separate examination shall be done resp. for the connection of the coaxial multi-point thermocouple special conditions for safe use shall be considered if applicable. An additionally assessment as an intrinsically safe system shall be done (e.g. connection of several circuits of different transmitters etc.).

Application in methane atmospheres

Due to the higher minimum ignition energy of methane, the devices may also be used to thereby caused explosive gas atmospheres. The device is optionally marked with IIC + Exd.

(10) Test documents are listed in the test report No. 10 203 555793.
Schedule EC-Type Examination Certificate No. TÜV 10 ATEX 55570 X

(17) Special conditions for safe use

1. For types with Ø <3 mm or "grounded measuring points" the intrinsically safe circuits shall be considered as galvanically connected to ground potential from a safety-related view. Potential equalization shall exist in the complete course of the erection of the intrinsically safe circuits. Furthermore, for the connection the requirements of EN/IEC 60079-14 shall be considered.

2. For devices that do not comply to the electrostatic requirements of EN/IEC 60079-0 and EN/IEC 60079-26 due to their construction, electrostatic charging shall be avoided.

3. The used transmitters/digital displays shall be provided with their own EC-Type Examination Certificate in accordance to EN/IEC. The installation conditions, the electrical characteristics, the temperature classes resp. the maximum surface temperatures of devices for the use in explosive dust atmospheres and the permissible ambient temperature shall be taken from the corresponding EC-Type Examination Certificate and shall be considered.

4. A reverse heat flow from the process exceeding the permissible ambient temperature of the transmitter, the digital display or the enclosure is not allowed and shall be avoided by a suitable thermal insulation or a suitable inner shell of the tubing.

5. In case of a wall thickness less than 1 mm the device may not be exposed to environmental conditions which may negatively affect the partition wall. A thermowell with a suitable minimum wall thickness can be used alternatively.

6. Using a thermowell/cooling tube the device shall be constructed in a way that allows an installation that results in a sufficient tight joint (IP67) or a tamperproof joint (EN/IEC 60079-1) in the direction of the less endangered area.

7. The circuits of the coaxial multipoint thermocouple shall be considered as connected due to their construction. For the application a separate examination shall be done resp. for the connection of the coaxial multipoint thermocouple special conditions for safe use must be considered if applicable. An additionally assessment as an intrinsically safe system shall be done (e.g. connection of several circuits of different transmitters etc.).

8. For the use of enclosures they shall either be provided with their own EC-Type Examination Certificate or they shall comply to the minimum requirements. IP-protection: at least IP20 (at least IP65 for dust) applies for all enclosures. Light metal enclosures, however, shall comply with the corresponding classes of the applicable standards. Non-metallic enclosures or powder-coated enclosures shall additionally comply with the electrostatic requirements of the applicable standards or have an corresponding warning marking.

**Dimensions in mm (in)**

**Français**

**Dimensions en mm (in)**

---

**Montage**

- Zulässige Umgebungstemperatur: -40 bis 85 °C (für Ex-Bereich siehe Ex-Zertifikate)
- Einbauort: Feldgehäuse; Sensorenanschlusskopf Form B nach DIN 43 729
- Einbauart: keine Einschränkungen
- Sicherheitshinweise: Das Gerät darf nur von einem Netzteil mit energiebegrenztem Stromkreis nach IEC 61010-1 gespeist werden: "SELV oder Class 2 circuit"

---

**Installation**

- Ambient temperature: -40 to 85 °C [-40 to 185 °F], for Ex-area see Ex-certification
- Installation area: Field housing; connection head Form B accord. to DIN 43 729
- Installation angle: No limit
- Safety notes: The unit must only be powered by a power supply that operates using an IEC 61010-1 compliant energy limited circuit: "SELV or Class 2 circuit"

---

**Montage**

- Temperature ambiante : -40 à 85 °C (pour zone Ex, voir certificat Ex)
- Position de montage : Boîtier de terrain; Tête de raccordement forme B selon DIN 43 729
- Implantation : Pas de restriction
- Conseils de sécurité : L'appareil doit obligatoirement être alimenté par une alimentation stabilisée selon IEC 61010-1: "SELV ou Class 2 circuit"

---

**Potenzialausgleich**

Bei abgesetzter Installation im Feldgehäuse ist zu beachten, dass die Schirmung der Ausgangseite (Ausgangssignal 4 bis 20 mA) und die Schirmung der Sensoranschlussseite mit gleichen Potentialen haben müssen. Bei Einsatz von geerdeten Thermoelementen wird eine Schirmung der 4-20 mA Ausgangsleitung empfohlen. In Anlagen mit großen elektromagnetischen Feldern wird eine Schirmung aller Leitungen mit niedrigerer Anbindung am Einbaugerät der Transmitter empfohlen.

---

**Potential level**

Please take note when installing the heat transmitter remotely in a field housing: The screen on the 4 to 20 mA signal output must have the same potential as the screen at the sensor connection.

When using earthed thermocouples screening of the output 4 to 20 mA cable is recommended. In plants with strong electromagnetic fields screening of all cables with a low ohm connection to the transmitter housing is recommended.

---

**Compensation de potentiel**

Dans le cas d'un montage séparé en boîtier de terrain, prêter de noter: Le blindage côté sortie (signal de sortie 4-20 mA) et le blindage côté capteur doivent être au même potentiel. Lors de l'utilisation de thermocouples mis à la terre, un blindage de la sortie 4-20 mA est recommandé. Pour les installations avec champs magnétiques importants, il est conseillé de procéder au blindage de toutes les lignes avec liaison à basse impédance au boîtier du transmetteur.
**Operation**

Head transmitter set-up is done using the ReadWin® 2000 PC software. This is available as an accessory (see page 8).

**Note**

When the interface cable is connected (see "Accessories" on page 8), the technical specifications (e.g., measured error) are not observed. For this reason, during operation disconnect the connection via the interface cable between the head transmitter and PC.

The following table shows the structure of the PC-Configuration software ReadWin® 2000 interactive menu operation:

Safety instructions (Intrinsic safety Ex ia)

1. Install in accordance with the manufacturer's specifications and the applicable standards and regulations.

2. Setting up the head transmitter (only TMT181 is possible) is only allowed to be done in a non-hazardous area.

3. Intrinsic equipment used for setting up must not exceed a voltage of Un = 30 V. This can, for example, be achieved by using battery powered laptop. Setting up with a mains powered PC Un = 253 V can only be done when using an approved adapter with barrier, e.g. TMT181A-VK.

4. When installing the unit note that the housing ingress protection classification IP 20 to EN 60529 is suitable.

Safety instructions for Zone 1 and 2

5. This device can, according to the manufacturer, be operated in Zone 1 (II 3G) or Zone 2 (II 3G). The current circuit can be fed into the Zone 0 (II 1 G) area. Conforms to description II 3G.

Safety instructions for Zone 0

6. Explosive gas-air mixtures are only allowed to be operated under atmospheric conditions:
   - -20 °C ≤ Ta ≤ +60 °C
   - 0.8 bar ≤ p ≤ 1.1 bar

If there is no explosive methane present or the additional measures according to EN 1127-1 are upheld the unit can also be operated outside the atmospheric conditions according to the manufacturer's specification.

7. The restricted ambient temperatures as per EN 1127-1 4.4.2 must be observed (see following table).

8. The power circuit to be supplied must meet the specifications for explosion protection Ex ia IIC (EN 60079-14 12.3).

9. The device can only be used in vessels if the process-wetted materials are sufficiently resistant to such fluids.
10. If the entire device is operated in Zone 0, the compatibility of the device materials with the fluid has to be ensured. (Housing: polyurethane (PU), potted polyurethane (PUR)).

11. The temperature transmitter must be installed in such a way that electrostatic charge cannot occur, e.g. installation in grounded metallic head or grounded housing.

(1) **EC-TYPE-EXAMINATION CERTIFICATE**
(Translation)

(3) **EC-TYPE-EXAMINATION CERTIFICATE** Number:

ZELM 99 ATEX 0019 X

(4) Equipment: Headtransmitter TEMPE Type TMT 181 resp. Type TMT 187 resp.

(5) Manufacturer: Endress + Hauser Werzler GmbH + Co. KG.

(6) Address: Obere Wank 1, D-87494 Neeshwang

(7) This equipment and any acceptable variation thereto are specified in the schedule to this certificate and the documents therein referred to.

(8) The Prüf- und Zertifizierungsstelle ZELM Ex, notified body No. 0820, in accordance with Article 9 of the Council Directive 94/9/EC of 23 March 1994, certifies that this equipment has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of equipment and protective systems intended for use in potentially explosive atmospheres, given in Annex I to the Directive.

The examination and test results are recorded in the confidential report ZELM Ex 04499/19206.

(9) Compliance with the Essential Health and Safety Requirements has been assured by compliance with:

- EN 50 014: 1997
- EN 50 020: 1994
- EN 50 284: 1999
- En 1127-1: 1997

(10) If the sign "X" is placed after the certificate number, it indicates that the equipment is subject to special conditions for safe use specified in the schedule to this certificate.

(11) This EC-type-examination Certificate relates only to the design and construction of the specified equipment in accordance with Directive 94/9/EC. Further requirements of this Directive apply to the manufacture and supply of this equipment.

(12) The marking of the equipment shall include the following:

II 1 G Ex ia IIC T6

Zertifizierungsstelle ZELM Ex

Dipl.-Ing. Harald Zelm

Sheet 1/3

---

**SCHEDULE**

(13) **EC-TYPE-EXAMINATION CERTIFICATE ZELM 99 ATEX 0019 X**

(14) Description of equipment

The headtransmitter is used for the measurement and signal transmission of resistive thermometers, thermocouples, resistance-type sensors and voltage sensors in a 4...20 mA current loop. The current input loop and the signal output are freely scalable via an interface. The measured value registration occurs via a D/A conversion. The readings data are evaluated via a D/A converter as a measurement signal in the 4...20 mA current loop. The available galvanic isolation is a function isolation between sensor circuit and supply circuit.

Different versions of the headtransmitter TEMPE Type TMT 181 resp. Type TMT 187 resp. Type TMT 188 do not concern the explosion protection and the electrical data.

The headtransmitter shall be used in the hazardous location. The headtransmitter is to be installed, so that the degree of protection IP 20 for the connectors is guaranteed in accordance with EN 60529.

The temperature ranges depending on the temperature class are to be taken from the following table.

<table>
<thead>
<tr>
<th>Lower ambient temperature limit</th>
<th>Upper ambient temperature limit</th>
<th>temperature class</th>
</tr>
</thead>
<tbody>
<tr>
<td>-40 °C</td>
<td>+55 °C</td>
<td>T 6</td>
</tr>
<tr>
<td>-40 °C</td>
<td>+100 °C</td>
<td>T 5</td>
</tr>
<tr>
<td>-40 °C</td>
<td>+125 °C</td>
<td>T 4</td>
</tr>
</tbody>
</table>

(15) Electrical data

**Supply circuit:**

- type of protection: intrinsically safe Ex ia IIC
- for connection to an intrinsically safe circuit with the following maximum values:
  
  \[ U_i = 30 \text{ V} \]
  
  \[ I_i = 120 \text{ mA} \]
  
  \[ P_i = 750 \text{ mW} \]

  effective internal capacitance and effective internal inductance are negligibly small.

**Setup circuit:**

- only for a short-time connection at a standard personal computer via the configuration set Type TMT 181 A to suitable connections; maximum r.m.s. a.c. or d.c. voltage \( U_i = 253 \text{ V} \).
1. Supplement
(Supplement according to EC-Directive 94/9 Annex III letter 6)
to EC-type-examination Certificate
ZELM 99 ATEX 0019 X
(Translation)

Equipment: Headdtransmitter ITEMP Type TMT 161 resp. Type TMT 187
resp. Type TMT 188

Manufacturer: Endress + Hauser WatZer GmbH + Co KG

Address: Obere Wank 1, D-87494 Nesselwang

Description of supplement

Only the headdtransmitter may be manufactured in future in accordance with the test documents listed in the test report ZELM Ex 0290019054. Therefore the old version of the headdtransmitter is not more manufactured for avoidance of the confusion of the electrical data.

The different versions and the marking remain unchanged.

Further the ambient temperature range remains unchanged, in particular with regard to the consideration of lesser ambient temperatures during the application in accordance with categorie 1.

Only the following data are valid for the future.

Data resp. measures for the explosion protection

**Electrical data**

Supply circuit: type of protection Intrinsic Safety Ex ia IIC for connection to an intrinsically safe circuit with the following maximum values:

\[
\begin{align*}
U_i &= 30 \text{ V} \\
I_i &= 100 \text{ mA} \\
P_i &= 750 \text{ mW}
\end{align*}
\]

- effective internal capacitance and effective internal inductance are negligibly small.

2. Supplement
(Supplement according to EC-Directive 94/9 Annex III letter 6)
to EC-type-examination Certificate
ZELM 99 ATEX 0019 X
(Translation)

Equipment:
Headtransmitter iTEMP Type TMT 181 resp. Type TMT 187
 resp. Type TMT 188

Manufacturer:
Endress + Hauser Weizler GmbH + Co.KG

Address:
Obere Wark 1, D-87484 Nesselwang

Description of supplement
The 2. Supplement to the EC-type-examination Certificate was necessary concerning the change of the circuit design due to additional EMC-capacitances.
The headtransmitter may be manufactured in future in accordance with the test documents listed in the test report ZELM Ex 0050117085 only. Therefore the old version of the headtransmitter is not more manufactured.
The electrical data, the different versions and the marking remain unchanged.
Further the ambient temperature range remains unchanged, in particular with regard to the consideration of lesser ambient temperatures during the application in accordance with category 1G.

Report No.
ZELM Ex 0050117085

Special conditions for safe use

The special conditions in accordance with EC-type-examination Certificate ZELM 99 ATEX 0019 X are maintained.

Essential Health and Safety Requirements

met by standards

Zertifizierungsstelle ZELM Ex
Braunschweig, May 25, 2001

Dipl.-Ing. Harald Zellm
4. Supplement

(to EC-type-examination Certificate)

**ZELM 99 ATEX 0019 X**

**Equipment:** Headtransmitter iTEMP Type TMT 191 resp. TMT 187 resp. TMT 188
**Manufacturer:** Endress+Hauser Watzler GmbH + Co.KG
**Address:**Obere Wattik 1, D-37486 Nesselwang

**Description of supplement:**
The 4. Supplement concerns insignificant modifications of the internal layout and increasing of the maximum value of the input power of the equipment. Further, the agreement of the device with current standards has been checked and the marking has been adapted correspondingly. The marking of the equipment is in future:

II 1G Ex ia IIC T6 resp. T5 resp. T4

Because the maximum value of the input power P, of the equipment has been increased the "Electrical data" are changed as follows:

**Electrical data**

**Supply circuit**
Type of protection Intrinsic Safety
Ex ia IIC
for connection to an intrinsically safe circuit with the following maximum values:

- $U_1 = 30 \text{ V}$
- $I_1 = 100 \text{ mA}$
- $P_1 = 760 \text{ mW}$

Effective internal capacitance and effective internal inductance are negligibly small.

**Setup circuit**
Only for a short-time connection of a standard personal computer via the configuration set Type TMT 191 A by suitable connections. Maximum r.m.s. a.c. or d.c. voltage $U_a = 233 \text{ V}$.

**Sensor circuit**
Type of protection Intrinsic Safety
Ex ia IIC resp. Ex ia IIb

Maximum values:

- $U_s = 8,2 \text{ V}$
- $I_s = 4,0 \text{ mA}$
- $P_s = 9,36 \text{ mW}$

(linear output characteristic)

IIIC resp. IIb

Max. permissible external inductance $4,5 \text{ mH}$
Max. permissible external capacitance $974 \text{ nF}$

EC-Declaration of Conformity

Note: This Declaration of Conformity and the CE-mark affixed to the nameplate are valid for the compressor within the Busch-scope of delivery. When this compressor is integrated into a superordinate machinery the manufacturer of the superordinate machinery (this can be the operating company, too) must be conduct the conformity assessment process acc. to the Directive Machinery 2006/42/EC for the superordinate machine, issue the Declaration of Conformity for it and affix the CE-mark.

For maintenance of this Declaration of Conformity of compressors without a drive may only be used a drive with a written consent of Busch.
